# List of Tables

1.1 Transit time of various dosage forms ........................................ 3

1.2 Anatomical and physiological features of GIT ............................. 5

1.3 Drugs explored in gastroretentive dosage forms .......................... 33

1.4 Commercial gastro retentive floating formulations .......................... 34

1.5 Ulcer Risk by Specific NSAIDS ............................................. 39

3.1 List of apparatus and equipment’s used ...................................... 61

3.2 List of chemicals used ......................................................... 62

3.3 Marketed preparations of famotidine ....................................... 69

3.4 Pharmacopeial specifications for pectin .................................... 76

3.5 Conditions for thin layer chromatography ................................... 90

3.6 Formulations with different blends of polymers and oil concentration .... 94

3.7 Characterization of different release mechanisms .......................... 99

4.1 Characteristic peaks found in IR spectra of Famotidine ................. 101

4.2 Calibration curve of famotidine in 0.1N HCl ................................ 102

4.3 Solubility profile of Famotidine at different pH ............................ 103

4.4 Partition coefficient of Famotidine ........................................... 104

4.5 Particle size distribution of famotidine ..................................... 107

4.6 Density and Flow properties of pure drug .................................. 110

4.7 Drug-excipient interaction at room temperature and at 40\(^{\circ}\)C and 75 \% RH .... 111

4.8 Visual observation of drug and excipient ................................... 111

4.9 Characteristic peaks found in IR spectra of Famotidine ................. 115

4.10 Preliminary studies for the polymer concentration ....................... 116

4.11 Preliminary studies for optimizing the height of syringe from the surface ... 116
4.12 Preliminary studies for optimizing the size of needle.........................116
4.13 Preliminary studies for optimizing the rate of dropping......................117
4.14 Preliminary studies for optimizing the speed of magnetic stirrer..........117
4.15 Preliminary studies for optimizing the concentration of curing agent.....118
4.16 Preliminary studies for optimizing the curing time..........................118
4.17 Comparative micromeritic studies of drug loaded floating gel beads.....124
4.18 Evaluation of shape of beads, Floating time, Lag time & Oil Leakage.....126
4.19 Evaluation of % Drug Loading and % Entrapment efficiency...............131
4.20 Evaluation of swelling Index....................................................135
4.21 Comparative evaluation parameters of our drug loaded optimized batches...139
4.22 Comparative floating behavior of drug loaded P₃₆, P₃₉, P₄₂, P₅₁ & P₅₄ gel beads in test solutions.........................................................139
4.23 Drug release profile of formulation F₁........................................141
4.24 Drug release profile of formulation F₂........................................142
4.25 Drug release profile of formulation F₃.........................................143
4.26 Drug release profile of formulation F₄.........................................144
4.27 Comparative release profile of all the four formulation.......................145
4.28 Release kinetics of optimized formulation F₁...................................146
4.29 Release Parameters of Optimized Formulation F₁.............................148
4.30 Stability Study Report of optimized formulation F₁............................149
4.31 Stability Study Report (Dissolution profile)....................................150
4.32 Mean diameter and buoyancy made in ratio of 2:1and various oil type.....151
4.33 Characteristics of beads having different curing agent......................155
4.34 Encapsulation efficiency and swelling ratio at different % of (CaCl₂).....155
4.35 Quantity of beads filled in capsule.............................................156
4.36 Buoyancy study of F_{FB} & F_{PD}........................................................................157
4.37 Drug release profile of formulation F_{FB}.................................................................158
4.38 Drug release profile of formulation F_{PD}..................................................................159
4.39 Comparative drug release profile of pure drug Famotidine and optimized floating
drug beads in capsule.................................................................................................161
