CONCLUSION

The present study will prove valuable addition to the treasure of frustration tolerance and altruism. But if we give a thorough vision, this will prove a neglected field of social psychology. Therefore the present piece of research provides fresh look that frustration tolerance and altruism are affected by religiosity of male and female subjects due to difference in religion Hindu, Muslim, Sikh and Christian subjects.

So, far as the researches tried to study frustration tolerance and altruism with reference to age, living area, family structure, no one tried to see the effect of religiosity on frustration tolerance and altruism. In my opinion as this study support the prediction that religiosity effect the frustration tolerance and altruism, that high religious individual are more frustration tolerant than low religious individual. The study also support that high religious subjects are also found high in altruism than low religious subjects.
