| Chapter IV | **Table 1.** Density ($\rho$), viscosity ($\eta$), refractive index ($n_0$) and dielectric constant ($\varepsilon$) of different mass fraction on CH$_3$NO$_2$ in PhNO$_2$ at 298.15K.  
**Table 2.** The concentration ($c$) and molar conductance ($\Lambda$) of NaPh$_4$B and Bu$_4$NPh$_4$B in different mass fraction of CH$_3$NO$_2$ in PhNO$_2$ at 298.15 K.  
**Table 3.** Limiting molar conductance ($\Lambda_o$), association constant ($K_A$), co-sphere diameter ($R$) and standard deviations of experimental $\Lambda$ of NaPh$_4$B and Bu$_4$NPh$_4$B in different mass fraction of CH$_3$NO$_2$ in PhNO$_2$ at 298.15 K.  
**Table 4.** Walden product ($\Lambda_o \cdot \eta$) and Gibb’s free energy change ($\Delta G^*$) of NaPh$_4$B and Bu$_4$NPh$_4$B in different mass fraction of CH$_3$NO$_2$ in PhNO$_2$ at 298.15 K.  
**Table 5.** The concentration ($c$), refractive index ($n_0$) and molar refraction of NaPh$_4$B and Bu$_4$NPh$_4$B in different mass fraction of CH$_3$NO$_2$ in PhNO$_2$ at 298.15 K.  
**Table 6.** The N-O stretching of the PhNO$_2$, CH$_3$NO$_2$ and their different binary mixtures.  
**Table 7.** The N-O stretching of the PhNO$_2$, CH$_3$NO$_2$ and their different binary mixtures in presence of NaPh$_4$B and Bu$_4$NPh$_4$B. | 144-149 |
| Chapter V | **Table 1.** Values of density ($\rho$), viscosity ($\eta$), refractive index ($n_0$), speed of sound ($u$), and dielectric constant ($\varepsilon$) of studied pure solvents at 298.15 K.  
**Table 2.** Molar conductance ($\Lambda$) and the corresponding concentration ($c$) of Bu$_4$NPF$_6$ in NM, DO and NB at 298.15 K.  
**Table 3.** Limiting molar conductivity ($\Lambda_o$), the association constant ($K_A$) and the distance of closest approach of ions ($R$) | 165-171 |
of Bu₄NPF₆ in NM and NB at 298.15 K.

**Table 4.** Walden product, ($\Lambda \eta_0$) and Gibb’s free energy change, ($\Delta G^*$) of Bu₄NPF₆ in NM and NB at 298.15 K.

**Table 5.** The calculated limiting molar conductance of ion-pair ($\Lambda_\eta$), limiting molar conductance of triple-ion ($\Lambda_\theta^t$) slope and intercept of Equation (11) of Bu₄NPF₆ in DO at 298.15 K.

**Table 6.** Salt concentration at the minimum conductivity ($c_{min}$) along with the ion-pair formation constant ($K_P$), triple-ion formation constant ($K_T$) of Bu₄NPF₆ in DO at 298.15 K.

**Table 7.** Salt concentration at the minimum conductivity ($c_{min}$), the ion-pair fraction $\alpha$, triple-ion fraction ($\alpha_T$), ion-pair concentration ($C_P$) and triple-ion concentration ($C_T$) for of Bu₄NPF₆ in DO at 298.15 K.

**Table 8.** Salt concentration ($c$), the ion-pair fraction ($\alpha$), triple-ion fraction ($\alpha_T$), ion-pair concentration ($C_P$) and triple-ion concentration ($C_T$) of Bu₄NPF₆ in DO at 298.15 K.

**Table 9.** Experimental values of molarity ($c$), densities ($\rho$), apparent molar volume ($\phi_v^0$), limiting apparent molar volume ($\phi_v^*$) and experimental slope ($S_v^*$) of Bu₄NPF₆ in NM, DO and NB at 298.15 K.

**Table 10.** Experimental values of molarity ($c$), miscosities ($\eta$), ($\eta / \eta_0 - 1$) / $\sqrt{c}$, viscosity $A$, $B$-coefficients of Bu₄NPF₆ in NM, DO and NB at 298.15 K.

**Table 11.** Experimental values of molarity ($c$), refractive index ($n_D$) and molar refraction (R₄) of Bu₄NPF₆ in NM, DO and NB at 298.15 K.

**Table 12.** Experimental values of molarity ($c$), speed of sound ($v$), adiabatic compressibility ($\beta_S$) and apparent
molar adiabatic compressibility ($\phi_K$), limiting apparent molar adiabatic compressibility ($\phi^0_K$), and experimental slopes ($S^*_K$) of Bu₄NPF₆ in NM, DO and NB at 298.15 K.

Table 1. Physical properties of solvent mixture o-toluidine + n-hexanol at 298.15K.

Table 2. Molar conductance ($\Lambda$) and the corresponding concentration ($c$) for R₄NI (R= butyl, pentyl, hexyl and heptyl) in different (0.00 and 0.25) mass fraction of o-toluidine (1) + n-hexanol(2) at 298.15K.

Table 3. Limiting molar conductance ($\Lambda_0$), association constant ($K_A$) co-sphere diameter ($R$) and standard deviations ($\sigma$) of experimental $\Lambda$ for the electrolytes in 0.00 and 0.25 mass fraction of o-toluidine(1) + n-hexanol(2) at 298.15K.

Table 4. Walden Products $\Lambda_0\eta$ and Gibb’s Energy Change $\Delta G^\circ$ for the electrolytes in 0.00 and 0.25 mass fraction of o-toluidine (1) + n-hexanol (2) mixtures at 298.15K.

Table 5. The calculated limiting molar conductance of ion-pair ($\Lambda_0$), limiting molar conductances of triple-ion $\Lambda_0^T$, for R₄NI (R = butyl, pentyl, hexyl, heptyl) in 0.50 and 0.75 mass fraction of o-toluidine (1) + n-hexanol (2) mixtures at 298.15K.

Table 6. Salt concentration at the minimum conductivity ($C_{\min}$) along with the ion-pair formation constant ($K_P$), triple-ion formation constant ($K_T$) for R₄NI (R = butyl, pentyl, hexyl and heptyl) in 0.50 and 0.75 mass fraction of o-toluidine (1) + n-hexanol (2) mixtures at 298.15K.

Table 7. Salt concentration at the minimum conductivity ($C_{\min}$), the ion-pair fraction ($\alpha$), triple-ion fraction ($\alpha_T$), ion-pair concentration ($c_P$) and triple-ion concentration ($c_T$) for
R₄NI (R = butyl, pentyl, hexyl, heptyl) in 0.50 and 0.75 mass fraction of o-toluidine (1) + n-hexanol (2) mixtures at 298.15K.

**Table 8.** The ion-pair fraction (α), triple-ion fraction (αₜ), ion-pair concentration (Cᵢ), triple-ion concentration (Cₜ) along with the concentration (C) of R₄NI (R = butyl, pentyl, hexyl, heptyl) in 0.50 and 0.75 mass fraction of o-toluidine (1) + n-hexanol (2) mixtures at 298.15K.

---

**Chapter VII**

**Table 1.** Density (ρ), viscosity (η) and relative permittivity (ε) of the solvents at 298.15K.

**Table 2.** The concentration (c) and molar conductance (Λ) of [EMIm]Br in different solvents at 298.15K.

**Table 3.** Limiting molar conductance (Λₒ), association constant (Kₐ), co-sphere diameter (R) and standard deviations of experimental Λ (δ) of [EMIm]Br in different solvents at 298.15K.

**Table 4.** Walden product (Λₒ·η) and Gibb’s energy change (ΔG) of [EMIm] in different solvents at 298.15K.

**Table 5.** Ionic limiting molar conductance (λₒ±), ionic Walden product (λₒ±·η), crystallographic radii (rₒ) and Stoke’s radii (rₛ) of [EMIm]⁺ and Br⁻ in different solvents at 298.15K.

**Table 6.** Diffusion Coefficient (D) and ionic mobility (i) of [EMIm]⁺ and Br⁻ in different solvents at 298.15K.

**Table 7.** Stretching frequencies of the functional groups present in the pure solvent and change of frequency after addition of [EMIm] Br in the solvents.

---

**Chapter VIII**

**Table 1.** Physical properties of aniline at 298.15 K.

**Table 2.** Molar conductances (Λ) and the corresponding concentration (c) for R₄NI (R = methyl, ethyl, butyl, pentyl, hexyl and heptyl) in aniline at 298.15 K.

**Table 3.** The calculated limiting molar conductances of ion-
pair ($\Lambda_o$), limiting molar conductance of triple-ion ($\Lambda_oT$), slope and intercept of equation $-1$ for $R_4NI$ ($R =$ methyl, ethyl, butyl, pentyl, hexyl and heptyl) in aniline at 298.15 K.

**Table 4.** Salt concentration at the minimum conductivity ($C_{min}$) along with the ion-pair formation constant ($K_P$), triple ion formation constant ($K_T$) for $R_4NI$ ($R =$ methyl, ethyl, butyl, pentyl, hexyl and heptyl) in aniline at 298.15 K.

**Table 5.** Salt concentration at the minimum conductivity ($C_{min}$), the ion pair fraction $\alpha$, triple ion fraction ($\alpha_T$), ion pair concentration ($C_P$) and triple-ion concentration ($C_T$) for $R_4NI$ ($R =$ methyl, ethyl, butyl, pentyl, hexyl and heptyl) in aniline at 298.15 K.

**Table 6.** The ion-pair fraction ($\alpha$), triple-ion fraction ($\alpha_T$), ion-pair concentration ($C_P$), triple-ion concentration ($C_T$) along with the concentration ($c$) of the tetraalkylammonium salts in aniline at 298.15 K.

**Table 1.** Density ($\rho$), viscosity ($\eta$) and relative permittivity ($\varepsilon$) of solvent mixtures at 298.15K.

**Table 2.** The concentration ($c$) and molar conductance ($\Lambda$) of LiAsF$_6$ in different mass fraction of EG ($w_1$) in MeOH at 298.15K.

**Table 3.** Limiting molar conductance ($\Lambda_o$), association constant ($K_A$), co-sphere diameter ($R$) and standard deviations of experimental $\Lambda$ ($\delta$) of LiAsF$_6$ in different mass fraction of EG ($w_1$) in MeOH at 298.15 K.

**Table 4.** Walden product ($\Lambda_o\cdot\eta$) and Gibb’s energy change ($\Delta G^\circ$) of LiAsF$_6$ in different mass fraction of EG ($w_1$) in MeOH at 298.15K.

**Table 5.** Ionic limiting molar conductance ($\lambda_o^+$), ionic Walden product ($\lambda_o^+\cdot\eta$), crystallographic radii ($r_c$) and Stoke’s radii ($r_s$) of Li$^+$ and AsF$_6^-$ ion in different mass...
fraction of EG ($w_1$) in MeOH at 298.15K.

**Table 6.** Experimental values of densities ($\rho$), apparent molar volume ($\phi$), viscosities ($\eta$), ($\eta/\eta_i - 1)/m^{1/2}$ of LiAsF$_6$ in different mass fraction of EG ($w_1$) in MeOH at $T = 298.15$ K.

**Table 7.** Limiting apparent molar volumes ($\phi^0$), experimental slopes ($S^*$), viscosity $A$ and $B$ coefficients of LiAsF$_6$ in different mass fraction of EG ($w_1$) in MeOH at 298.15 K.
