# List of Figures

1.1 3D Surface Reconstruction for face images ........................................ 5  
1.2 Short taxonomy of shape acquisition methods ..................................... 6  
1.3 Geometry of stereo vision system ...................................................... 11  
1.4 Epipolar geometry ........................................................................... 12  
1.5 Flow-diagram of Stereo Vision System .............................................. 14  
1.6 Stereo Image Rectification ............................................................... 15  
1.7 Camera Calibration System ............................................................... 17  
1.8 Calibrated Stereo Image Rectification (a) and (b) Original Image pair; (c)  
    and (d) Rectified Image pair (courtesy Fusiello et al.,2000) ................. 19  
1.9 Uncalibrated Stereo Image Rectification (a) and (b) Original Image pair; (c)  
    and (d) Rectified Image pair (courtesy Fusiello et al.,2008) ................. 20  
1.10 Stereo Correspondence ..................................................................... 21  
1.11 Generalized block diagram of a stereo correspondence algorithm ........ 21  
1.12 Diversity of stereo methods  division into local and global methods ...... 22  
1.13 Area-Based Stereo Matching ......................................................... 25  
1.14 Disparity map obtained on middlebury database; (a) and (b) left and right  
    stereo image pairs; (c) disparity map computed using SAD and (d) disparity  
    map computed using NCC ............................................................. 26  
1.15 Block diagram of Triangulation principle ......................................... 27  
1.16 Importance of corners and junctions in visual recognition and an image ex-  
    ample with interest points provided by a corner detector (Courtesy of Tinne  
    Tuyltelaaers et al.) ....................................................................... 29  
1.17 Detected features in images ........................................................... 31
1.18 A schematic representation of Lowes [86] Scale Invariant Feature Transform (SIFT). Gradient orientations and magnitudes are computed at each pixel and then weighted by a Gaussian falloff (blue circle). A weighted gradient orientation histogram is then computed in each subregion, using trilinear interpolation. ................................................................. 35

1.19 The Gradient Location-Orientation Histogram (GLOH) descriptor uses log-polar bins instead of square bins to compute orientation histograms (Mikolajczyk and Schmid 2005) ................................................................. 36

1.20 Feature matching results ................................................................. 38

1.21 Underwater laser imaging (http://www.3datdepth.com) ....................... 39

1.22 Underwater sonar imaging (http://oceaneplorer.noaa.gov) .................... 41

1.23 Underwater stereo camera setup (http://webee.technion.ac.il) ............... 43

1.24 Underwater optical imaging using stereo camera in deep ocean (Courtesy Yoav Y. Schechner) ................................................................. 44

1.25 Stereo camera setup .................................................................. 46

1.26 Underwater stereo test images: first row - dataset1; second row - dataset2; third row - dataset3 ................................................................. 47

1.27 Flow Diagram of the Thesis .......................................................... 48

2.1 Degraded underwater images which are blurred, hazed, affected by non-uniform illumination and sunlight flicker (http://webee.technion.ac.il) ........ 52

2.2 Components of light propagating in a underwater environment: direct component (-), light ray which is reflected by an objects surface (···) and the backscattered component (─ · · · ◁), the light scattered by the medium. (courtesy Erickson Nascimento et al.) .......................................................... 53

2.3 Subbands of the 2-D orthogonal wavelet transform .................................. 60

2.4 The Result of 2D wavelet decomposition of underwater image at level 3 ....... 61

2.5 Underwater test images ................................................................ 68

2.6 First column: original image, second column: after homomorphic filtering, third column: after wavelet denoising, fourth column: after bilateral filtering, last column: after contrast equalization ........................................ 69
2.7 Edge detection results on four images; First row: edge detection results on original images, Second row: edge detection results on preprocessed images 70

2.8 Gradient magnitude histogram of the four images; Red line: the gradient magnitude histogram of the original image, Green line: the gradient magnitude histogram of the preprocessed image .......................... 70

2.9 Comparison of our approach with Bazeille approach [9]; first row - our approach, second row - Stephane Bazeille approach ........................................ 71

3.1 The flow diagram of our approach .............................................. 79

3.2 Comprehensive color normalized images .................................... 81

3.3 Disparity Map using dataset1, dataset2 and dataset3: first column - SAD; second column - SSD; third column - NCC; fourth column - ZNCC; fifth column - Our approach using window size $5 \times 5$ ........................................ 81

3.4 Disparity Map for dataset1, dataset2 and dataset3 computed using our approach (AWCC) with different window-size: first column - $5 \times 5$; second column - $7 \times 7$; third column - $9 \times 9$; fourth column - $11 \times 11$ .......... 82

3.5 Disparity Map computed using our approach for image blur variation; first column - left image, second column - right image with blur variation, third column - obtained disparity map ........................................ 82

3.6 Disparity Map computed using our approach for image illumination variation; first column - left image, second column - right image with illumination variation, third column - obtained disparity map ........................................ 83

4.1 Example of a directed capacitated graph. Edge costs are reflected by their thickness. A similar graph-cut construction was first used in vision by Greig et al. [48] for binary image restoration ........................................ 92

4.2 Disparity Map computed for MRF-BP + Graph Cuts on three datasets: first column - left image; second column - right image; third column - disparity map ........................................ 95

4.3 Disparity Map computed using our approach for blur variation; first column - left image, second column - right image with blur variation, third column - disparity map ........................................ 96

<td>An image in (a) is a set of pixels $P$ with observed intensities $I_p$ for each $p \in P$. A labeling $L$ is shown in (b) assigns some label $L_p \in {0,1,2}$ to each pixel $p \in P$. Such labels can represent depth (in stereo), object index (in segmentation), original intensity (in image restoration), or other pixel properties. Thick lines in (b) show labeling discontinuities between neighboring pixels. (Courtesy Yuri Boykov and Vladimir Kolmogorov)</td>

5.9 3D surface model with texture for dataset1, dataset2 and dataset3 respectively 118
5.10 3D surface model at different views of dataset1 (first row), dataset2 (second row) and dataset3 (third row) respectively .......................... 119
5.11 Scenario I: 3D surface model for dataset1, dataset2 and dataset3 respectively 120
5.12 Scenario II: 3D surface model for dataset1, dataset2 and dataset3 respectively 120

6.1 The blurred images at different scales, and the computation of the Difference-of-Gaussian images ......................................................... 130
6.2 Local extrema detection, the pixel marked $X$ is compared against its 26 neighbors in a $3 \times 3 \times 3$ neighborhood that spans adjacent DoG images .... 130
6.3 Underwater normalized and rectified stereo images: first row - dataset1; second row - dataset2; third row - dataset3 ..................................... 135
6.4 Detected interest points in rectified left image of dataset1, dataset2 and dataset3 respectively using SIFT (DoG) ........................................ 135
6.5 Correspondences computed for dataset1, dataset2 and dataset3. The red colored ‘*’ marks correspond to the interest points in the left image, while blue colored ‘*’ marks are their matchings in the right image .............. 135
6.6 Matched feature points for dataset1, dataset2 and dataset3 respectively . 136
6.7 Stereo images with blur variation; first column - left image, second column - right image with blur variation ............................................. 137
6.8 Stereo images with illumination variation; first column - left image, second column - right image with illumination varied .......................... 138

7.1 The first two images represent the discretised Gaussian second order partial derivative in $y$ ($L_{yy}$) and $xy$ direction ($L_{xy}$) respectively. The last two images represent the approximation for the second order Gaussian partial derivative in $y$ ($D_{yy}$) and $xy$ direction ($D_{xy}$). The gray regions assumed to be zero. ... 147
7.2 Graphical representation of the filter side lengths for three different octaves. The logarithmic horizontal axis represents the scales. Note that the octaves are overlapping in order to cover all possible scales seamlessly .............. 148
7.3 LBP and CS-LBP features for a neighborhood of 8 pixels .................. 149
List of Figures

7.4 Enhanced Underwater Images (left image and right image): first row - dataset1; second row - dataset2; third row - dataset3 .......................... 151

7.5 Feature detected using our approach (SURF) for left image of dataset1, dataset2 and dataset3 respectively ................................. 152

7.6 Blur variation for dataset1, dataset2 and dataset3: (a) left image (b) right image with blur radius 15 ........................................... 153

7.7 Blur Radius v/s Repeatability (a) dataset1 (b) dataset2 and (c) dataset3 . 154

7.8 Illumination variation for dataset1, dataset2 and dataset3: (a) left image, (b) right image with illumination varied using Photoshop .................. 155

7.9 Scale variation for dataset1, dataset2 and dataset3: (a) left image (b) right image with scale variation 1.2 ................................. 156

7.10 Scale Variation v/s Repeatability (a) dataset1, (b) dataset2 and (c) dataset3 156

7.11 Rotation angle variation for dataset1, dataset2 and dataset3: (a) left image (b) right image with rotation angle 10 degree .................... 157

7.12 Rotation Angle v/s Repeatability (a) dataset1, (b) dataset2 and (c) dataset3 158

7.13 Comparison of proposed LBP-SURF with SIFT and SURF for dataset1 (left), dataset2 (center) and dataset3 (right) ....................... 159

7.14 Comparison of proposed LBP-SURF with Original Image (Before Preprocessing) and Enhanced Images (After Preprocessing) for dataset1 (left), dataset2 (center) and dataset3 (right) ................................. 159
# List of Tables

2.1 The Comparison of four wavelet filter banks based on PSNR (dB) .......................... 68
2.2 The Comparison of five wavelet shrinkage functions based on PSNR (dB) ............. 68
2.3 The Contrast of the Original image $C(I)$ and the enhanced images using our approach $C(I_{our})$ and Bazeille et al. approach $C(I_{ste})$ ........................................ 69

4.1 Comparison of processing time for combination of image preprocessing methods with Graph Cuts based stereo matching ............................... 100

5.1 Comparison of processing time for combination of Scenario I and Scenario II 121

6.1 Comparison of feature detection methods for comprehensive color normalized images of dataset1, dataset2 and dataset3 .................................................. 136
6.2 Comparison of feature detection methods for blur variation .................................. 138
6.3 Comparison of feature detection methods for illumination variation .................... 139
6.4 *Recall* and *Precision* values for feature matching of dataset1, dataset2 and dataset3 .................................................................................................................. 140

7.1 Comparison of feature detectors for dataset1, dataset2 and dataset3 .................. 152
7.2 Comparison of Feature Detector with Illumination Variation for dataset1, dataset2 and dataset3 ................................................................. 155
