ACKNOWLEDGEMENTS

A Ph.D. research, especially in applied fields, is never a solo undertaking: combined efforts of a team are needed to realize the concepts and ideas. As such, first of all I would like to thank Dr. Winkins Santosh, supervisor of the research, for his continuous support and guidance during past few years.

I would also like to express my gratitude to Dr. T. Hema Thanka Chrislet, for support, advice and encouragement that went well beyond the call of duty.

Most of the ideas that shaped this research came from regular doctoral meetings of our doctoral members for the last three years. I would like to thank present doctoral members of this research, Prof. Ponnuasamy and Dr. W. Arunai. Also I would like to thank previous doctoral member of this research, Dr. Ramasamy. Special thanks go to Dr. Suresh Kumar, neurologist, who shared with me lots of ideas and assist with recruitment of research participants. I thank all the participants, for their selfless contribution of samples and sharing their experiences with me and without whom this research would have been impossible.

My outmost gratitude goes to my colleagues V. Karthikeyan and S. Manjunath Kamath for providing a dynamic and stimulating environment, insightful discussions and the good time we had together. I would also like to thank the Drs.
Mohamed Ali, N. Selvamurugan, Srinivasan Thyagarajan, E. Berlathagam, R. A. Nazzer, S. Bharathi, D. V. L. Sarada and W. Richard Thilagaraj for their encouragement during these years.

All these would be impossible without care, patience and love of my parents who were besides me in all the sunny and cloudy days.

I’d like to thank SRM University for the financial support and fellowship.

I would also like to dedicate this thesis to the memory of my grandmother who died because of Parkinson’s disease.
