Abstract

This is the comparative study of the personalities of adolescent girls studying in separate secondary schools for girls and girls studying in co-education secondary schools.

For the research study survey method has been used. The sampling is collected from the secondary schools of Sangli District in Maharashtra State. To collect the data, Eysenck’s Personality Inventory has been administered. Data is collected from twenty secondary schools which are selected by simple random sampling.

Three personality factors Extraversion, Psychoticism and Neuroticism are selected for the study.

The collected data is then classified. After the analysis of data, sten score has been calculated. Then by using ‘t’ test, ‘t’ value has been calculated. Calculated ‘t’ value and table ‘t’ value have been compared.

The results showed that there is no significant difference between the personalities of the adolescent girls studying in separate secondary schools for girls and girls studying in co-education at Sangli District with respect to the personality factors Extraversion, Psychoticism and Neuroticism.
