# Contents

1 Introduction.  
   1.1 The Jarzynski equality and the fluctuation theorems  
   1.2 Ratchets, heat engines and molecular motors  
      1.2.1 Feynman’s ratchet and pawl model  
      1.2.2 Other ratchet models  

2 Work distribution functions for Hysteresis loops in a single spin system.  
   2.1 Introduction  
   2.2 Definition of model and dynamics  
   2.3 Results from Monte-Carlo simulations  
      2.3.1 Field increased linearly from 0 to $\epsilon$  
      2.3.2 Field is taken around a cycle  
      2.3.3 Properties in the non-equilibrium steady state  
   2.4 Analytic results for slow and fast rates  
      2.4.1 Field increased linearly from 0 to $\epsilon$  
      2.4.2 Field is taken around a cycle  
   2.5 Conclusions  

3 Simple models of heat pumps.  
   3.1 Introduction  
   3.2 Spin System  
   3.3 Oscillator System
3.4 Conclusions .................................................. 61

4 Particle pump with symmetric exclusion process. ........................................ 62
  4.1 Introduction .................................................. 62
  4.2 Definition of Model .......................................... 63
  4.3 Perturbation theory in $f_i$ .................................... 66
  4.4 Perturbation theory in $1/\omega$ ................................ 76
  4.5 Adiabatic calculation ......................................... 78
  4.6 Conclusions .................................................. 79
