1. INTRODUCTION

2. REVIEW OF LITERATURE

2.1 Geminiviruses
2.2 Mungbean yellow mosaic virus (MYMV)
  2.2.1 Genome organization of MYMV
  2.2.2 MYMV replication
  2.3 Controlling MYMV: Strategies involved
    2.3.1 Genetic engineering: an efficient alternative against viruses
    2.3.2 Coat Protein Mediated Resistance (CPMR)
    2.3.3 RNA-mediated resistance (RNAi)
      2.3.3.1 Mechanism of RNAi
      2.3.3.2 RNAi and Plant Viruses
      2.3.3.3 RNAi against Viruses
    2.3.4 Viruses against RNAi: Viral Suppressor Proteins
    2.3.5 Mechanism of VSRs (Viral Suppressors)
    2.3.6 Antisense VS RNAi
  2.4 In vitro regeneration and genetic transformation of mungbean
    2.4.1 In vitro regeneration
      2.4.1.1 Somatic embryogenesis
      2.4.1.2 Direct shoot organogenesis
      2.4.1.3 Organogenesis from callus
    2.5.1 Reporter genes
    2.5.2 Selectable marker genes
  2.6 Optimization of transformation efficiency
  2.7 Genetic transformation of mungbean
    2.7.1 Agrobacterium-mediated transformation
    2.7.2 Direct DNA transfer methods
      2.7.2.1 Particle bombardment

3 MATERIALS AND METHODS

3.0 In vitro plant regeneration
  3.1 Plant material
  3.2 Seed sterilization and germination
  3.3 Preparation of explants
  3.4 Effect of preconditioning on explants
  3.5 Culture conditions and statistical analysis of data
  3.6 Effect of hormones on multiple shoot regeneration
    3.6.1 Effect of BAP and other cytokinins
    3.6.2 Effect of different auxins
  3.7 Effect of age and type of explants
3.8 Effect of genotype
3.9 Rooting of shoots
3.10 Establishment of rooted shoots (or plantlets) in soil
3.11 Optimization of selection system
3.11.1 Selection system for transformed shoots
3.11.2 Selection system for root induction
3.12 Optimization of transformation protocol
3.12.1 Bacterial strain and vector
3.12.2 Methodology
3.12.3 Enzyme (GUS) assay
3.13 Transformation of mungbean
3.13.1 Plant transformation vector(s)
3.13.2 Colony PCR
3.13.3 Agarose gel electrophoresis
3.13.4 Agrobacterium inoculation
3.13.5 Co-cultivation of explants
3.13.6 Regeneration of putative transformed plants
3.14 Molecular analysis of transgenic plants
3.14.1 Isolation of genomic DNA
3.14.2 Purification of plant DNA
3.14.3 Quantification and quantity of DNA
3.14.4 PCR analysis of putative transgenic plants
3.15 Southern hybridization of PCR positive T<sub>0</sub> mungbean plants
3.15.1 Restriction of plant genomic DNA
3.15.2 Gel electrophoresis
3.15.3 Transfer of DNA to the nylon membrane
3.15.4 Pre-hybridization
3.15.5 Preparation of radio labeled nptII probe
3.15.6 Radio-labeling of the probe
3.15.7 Hybridization
3.15.8 Washing
3.15.9 Autoradiography
3.15.10 Determination of DNA fragment size and copy number
3.16 RT-PCR
3.17 Analysis of T<sub>1</sub> progeny
3.17.1 PCR analysis of T<sub>1</sub> transgenic plants
3.17.2 Plant inoculation and development of disease symptoms
3.17.2.1 Agro-inoculation
4 RESULT AND DISCUSSION
4.0 Regeneration and multiple shoot formation
4.1 Choice of explants
4.1.1 Cotyledonary node
4.1.2 Primary leaf explants
4.2 Effect of preconditioning
4.3 Multiple shoot regeneration from cotyledonary node
4.3.1 Effect of different concentrations of BAP and other cytokinins
4.3.2 Effect of age of donor seedling
4.3.3 Effect of genotype
4.4 Multiple shoots regeneration from primary leaf explants
4.4.1 Effect of BAP and other cytokinins
4.4.2 Effect of interaction of BAP and Auxins
4.4.3 Effect of age of explants
4.4.4 Effect of explant type (variations of primary leaf)
4.4.5 Effect of genotype
4.5 Rooting and establishment of plant in soil
4.6 Development of selection system
4.6.1 Effect of phosphinothricin (PPT) on shoot regeneration
4.6.2 Effect of kanamycin on shoot regeneration
4.6.3 Effect of phosphinothricin on root organogenesis
4.6.4 Effect of kanamycin on root induction
4.7 Factors affecting Agrobacterium-mediated gene transfer
4.7.1 Effect of bacterial concentration
4.7.2 Effect of bacterial inoculation time
4.7.3 Effect of co-cultivation period
4.7.4 Effect of acetosyringone
4.7.5 Effect of pre-culture of explants
4.7.6 Effect of pH
4.7.7 Effect of antioxidants
4.7.8 Effect of temperature
4.7.9 Effect of mechanical injury of explants
4.8 Genetic transformation of Vigna radiata via Agrobacterium tumefaciens strain LBA4404 containing a binary vector pSP7 to check transient GUS expression
4.9 Regeneration of transgenic plants with plasmid SP7
4.9.1 Molecular analysis of putative transgenic plants regenerated using cotyledonary node
4.10 Stable genetic transformation of Vigna radiata cv. K851 using primary leaf explants and Agrobacterium tumefaciens EHA 105 (pGD3)
4.10.1 Molecular analysis of transgenics
4.10.1.1 PCR analysis for nptII and virA gene
4.10.1.2 Southern hybridization
4.10.1.3 RT-PCR
4.11 Analysis of T₁ progeny
4.11.1 PCR analysis of T₁ progeny
4.11.2 Agro-inoculation of PCR +ve T₁ plants
5. SUMMARY, CONCLUSIONS AND FUTURE PROSPECTS 80-84
REFERENCES 85-100
