Acknowledgments

First and foremost, I would like to thank Prof. Shona Chattarji for providing encouragement and supporting me throughout the course of my Ph.D. research. While the lab focused on the amygdala, Shona gave me the freedom to go ahead and work on hippocampus-mediated behaviour and then later encouraged me to take up the hippocampal place cell recording technique. It is indeed the result of such freedom that I now feel confident enough to take up new challenging projects. I hope that one day, I shall be able to motivate the next generation of students the same way.

I would like to thank Dr. Matt Jones, who first taught me place cell recordings at his laboratory. Thanks to “The Company of Biologists” that granted me the JEB fellowship so that I could travel to Matt’s laboratory at the University of Bristol, UK. A special thanks to Dr. Thomas (Tom) McHugh who allowed me to conduct place cell recording experiments in his laboratory at the Brain Science Institute, RIKEN, Japan. Thanks to Denis Polygelov, from Tom’s laboratory for running the MATLAB codes on my data. It is this conversion of voltage values across time stamps into a tabular format that allowed me to think objectively about the science that I have presented in the first half of this thesis. I would like to thank my thesis committee members Upi and Laxmi for their support.

A special thanks to Supriya Ghosh, the fellow graduate student in Shona’s laboratory, with whom I collaborated on the auditory fear conditioning project. It was my first experience with generating hypotheses and testing their feasibility within a couple of days. This indeed was the most exciting and scientifically stimulating time in my fledgling science career. I am grateful to Dr. Rajnish Rao (Osho) and Dr. Rohan Kamath for proof reading parts of this thesis and I would like to thank Dr. Kapil for all the help and expertise he provided with the formatting of this document that I call my “thesis”. I would also like to thank Shobha Anilkumar, a wonderful researcher and a great human being with whom I collaborated on acute-stress Diazepam study (this study is not part of this thesis). I have learnt a lot from Shobha and other past and present lab members and for this I am grateful to all of them. I would like to thank the lively and vibrant community of NCBS whose kind support I have enjoyed throughout my long stay at NCBS. Thanks to Andersen and colleagues for marvelously documenting the knowledge on hippocampal research in “The Hippocampus Book”. I have learnt a lot from this book and Chapter-1 of this thesis is greatly influenced by it.

I would like to express my gratitude to all my friends, some of whom have already gotten a mention above. Because of spatiotemporal constrains, I cannot name them individually. Neither will I mention more about their kindness and generosity, as it will make a thesis of its own. However, I sincerely hope to have them all as my friends for the rest our lives. Thanks for all the Mandara hostel parties and Saturday evening gatherings that made life full of fun, proof of which, though misrepresented, remains stuck in the form of a note at various locations in Mandara.

Importantly, I thank my family for being patient and asking only “occasionally” about when am I going to finish my studies and get a real job. A very special thanks to Lalitha Krishnan, for all the proof reading, adding “the”s and “a”s in this thesis and correcting other grammatical errors. Thanks for being patient and supportive for the past 6 months and I hope I will continue getting her Unconditional support (US), especially when the going gets tough!
