Acknowledgements

First of all I wish to thank the National Institute of Oceanography for providing me an opportunity to work for this thesis while I was working as a Project Trainee. It is indeed a great gesture from this esteemed institution, which supports several young students wishing to improve their qualification while working for various scientific programs on contract. The former director Dr. E. Desa was kind enough to permit me to register for the Ph.D. and to utilize the facilities. The friendly and supporting attitude of several NIO-members has helped me to accomplish this work.

I gratefully thank Dr. Virupaça Banakar for introducing me to this fascinating field of palaeoclimate. No words would express my deep sense of gratitude to Dr. Banakar, who has been a smiling source of inspiration and a tough taskmaster. He motivated and encouraged me a lot to understand the research problem and address the palaeoclimate issues.

I sincerely thank Drs. N. B. Bhosle, M. V. S. Gupta and A. L. Paropkari for patiently reading the draft thesis and constructive suggestions. The discussions with Dr. Satish Shetye were of great help in writing the coastal currents and monsoon relationships. The help of professors Tadamichi Oba, M. Yamamoto, and Dr. T. Kuramoto of the Hokkaido University, Japan in obtaining the stable isotope and organic component data, and Dr. V. Ramaswami in obtaining grain-size data on laser particle analyzer is sincerely acknowledged.

The encouragement and support by senior colleagues Drs. R. Ngam, G. Parthiban, J. N. Pattan, N. Ramaiah, P. Marathe, P. D. Naidu, A. V. Mudholkar and M. Thamban, and my friends Rajan, Avina, Anjelina, Ranjita, Velina, etc, while on cruise for sampling and in lab for analytical work, gave me lot of strength to accept challenges in advanced marine research work. I thank Hilda, Usha, Pratima, Sunithi, Lina, Lucinda and many others at National Institute of Oceanography for all the support and help.

When the part of this work was selected (out of over 1100 papers submitted) for the International Young Scientists Global Climate Change Conference-2003 at Trieste, Italy as an invited paper by the START Secretariat (USA), it was a nice feeling and exciting experience to present this work in front of several experts in the field. I sincerely thank the START for that opportunity. I gratefully acknowledge the EMR, CSIR, New Delhi for awarding me with Senior Research Fellowship.

The encouragement and guidance by my co-supervisor Prof. U. M. X. Sangodekar of the Goa University and the FRC members Drs. N. N. Hashimi, and Vishwanath, and time-to-time administrative and scientific guidance by Prof. G. N. Nayak, HOD of Marine Sciences, Goa University were of great help.

Last but not least, the sustained love and support of my husband Ritesh, parents, uncles, aunts, brothers, sisters, and in-laws gave me energy to complete this work. Although just few months old, my young daughter lovely Isha did not trouble me much while finalizing this thesis and has been additional source of energy for me in pursuing the challenging tasks of oceanographic science.

Anjali R. Chodankar.
