## LIST OF TABLES

1.1 Comparison of Component Based and Object Oriented Approaches
4.1 Values of Probabilities of Transition
4.2 Overall System Reliability for various Reliabilities values for different Components
4.3 Number of Components and System Reliabilities
5.1 Means and Standard Deviations for execution links (Case 1)
5.2 Simulation Output (Criticality Indices of Execution Links) (Case 1)
5.3 Simulation Output Data (Criticality Indices of Components) (Case 1)
5.4 Means and Standard Deviations for execution links (Case 2)
5.5 Simulation Output (Criticality Indices of Execution Links) (Case 2)
5.6 Simulation Output Data (Criticality Indices of Components) (Case 2)
6.1 Comparison of time taken by search process using CAS and without using CAS (Component Attribute System)
6.2 Comparison of the level of precision achieved using CAS and without using CAS
6.3 Comparison of the frequency of reuse of a component while using CAS and without using CAS
6.4 Comparison of Effort required using CAS and without using CAS
7.1 Originating Component, Terminating Component and Criticality Indices of Interface Links (Case 1)
7.2 Component Criticality Indices (Case 1)
7.3 Originating Component, Terminating Component and Criticality Indices of Interface Links (Case 2)
7.4 Component Criticality Indices (Case 2)
8.1 Results for various values of Simulation Runs (SRUNS)
8.2 Results for various values of \( \lambda \) (characteristic of system) for 50000 simulation runs
