List of Tables

**Table 1.1**: Half-life and principal radiation energy of $^{222}\text{Rn}$, $^{220}\text{Rn}$ and their decay products........................................................................................................................................3

**Table 3.1**: Comparison of radon growth rate constants estimated using Eq. (53) with those obtained by exponential fitting to the headspace concentration predicted by 2-D theory for the chambers. The text in bold represents the best matching of the rise rate constants predicted by the two approaches................................................................................................................63

**Table 3.2**: Estimated radon emission parameters after least square fitting of 2-D model to the radon build up data in the chamber parameters...........................................................................71

**Table 4.1**: Parameters ($\bar{C}_\infty$, $\lambda_c$) obtained by fitting the exponential form of the 2-D model (Eq.(51)) to the data points shown in the Fig. 9 and the derived pre-deployment flux ($f_0$) and soil diffusion coefficient ($D_s$) from these parameters.........................................................79

**Table 4.2**: Comparison of estimated pre-deployment flux density and time constant for different chambers used in the third set of experiments.........................................................79

**Table 4.3**: Relative variations in time constant with respect to change of multiplicative term $a.H$ (product of chamber radius and height).................................................................80

**Table 4.4**: Variations in radon saturation concentration with respect to radius of chamber.................................................................................................................................80

**Table 4.5**: The mean of measured tailings parameters along with standard deviation in winter, summer and rainy seasons for 40 locations of the tailings pond........................................89

**Table 5.1**: Various parameters of soil estimated using soil samples and measured radon concentration in the pore space of the soil matrix.................................................................111
Table 5.2: Model predicted and experimentally measured radon fluxes at various distances from edge of the seal.

Table 6.1: Lists of estimated parameter ‘k’ from the fitting procedure in Fig. 6.3 and the corresponding $R^2$ showing the goodness of fit.

Table 6.2: Measured and predicted radon fluxes for concrete block samples using measured physical parameters. Each sample has dimensions: $a=b=h=10$ cm.
