5. **FUTURE SCOPE**

1. Cancer cell cycle analysis in detail has to be performed using high end technology to understand the mechanism in detail.

2. The obtained results clearly reveal that the bioactive components in the form of tri-terpenoids and saponins have to be further investigated to confirm the bioactive principle. On the basis of this it is easy to assess whether the compound is individual and synergistic.

3. Structural elucidation has to be done for the HPLC and NMR spectral data obtained for the tri-terpenoids and saponins.

4. Last but not the least; we need collaboration with research laboratories actively involved in anti-cancerous investigation.
