List of Tables

3.1 NIKFI BR-2 Nuclear Emulsion Detector (NED) Composition. . . 35

4.1 Mean multiplicity values of different projectile fragments ..................74
4.2 Different emission channels of projectile fragmentations......................... 80
4.3 The average multiplicity $< N_{\text{alpha}} >$, the $< C_q >$ moments and the second Muller moment $< F_2 >$ for alpha fragments emitted from projectile in different nucleus-nucleus collisions at various energies. Values are arranged according to increasing order of atomic mass number of projectiles.......................... 85
4.4 Mean multiplicity values of other secondary particles related to the participants and target spectator regions for different alpha fragments emission channels in different NED target groups................. 86
4.5 Multiplicity distribution of projectile fragment alpha has been fit- ted with the Gaussian function and the fitting parameters values are listed..................................................................................93
4.6 Fitted Rayleigh scattering function parameters for the concept of two sources of projectile fragment alpha emission during nucleus- nucleus interactions at high energy. Rayleigh scattering function was fitted on the data of the transverse momentum distribution of $^{84}\text{Kr}_{36}$ interactions with NED target nuclei at different kinetic energies ranging from around 2 to 0.5 GeV per nucleon......................... 93
