AIMS AND OBJECTIVES
AIMS AND OBJECTIVES

1. To compare the MR signal intensity measurements in brains of fetuses with central nervous system anomalies and those fetuses having normal brains.

2. To evaluate the possible role of MR signal intensity measurements to diagnose Central Nervous System anomalies antenatally.

Specific objectives:

- The transverse MR images of fetuses to be studied

- To obtain the signal intensity measurements of the designated regions in fetal brain

- Using Postnatal findings or autopsy as gold standard for establishing the diagnosis, the range of value in normal brains and in anomalous fetuses to be derived and compared

- To evaluate the contribution of MR Signal intensity measurement in diagnosis
