<td>52</td>
</tr>
<tr>
<td>Figure 2.2 (a) Oxygen is physi- or chemisorbed onto semiconductor surface and an electron from the conduction band is lost creating a depletion layer. This decreases the conductance of the semiconductor. (b) When a target gas molecule R is present, it reacts with the adsorbed oxygen, gets removed from the surface, and releases and electron into the conduction layer. This increases the conductance of the semiconductor.</td>
