ACKNOWLEDGEMENTS

The work presented in this thesis was carried out with the aid of financial assistance from the Ministry of Education and the Department of Atomic Energy of the Govt. of India. My grateful thanks are due to the Director General of Observatories for providing facilities to establish the Low frequency recording unit at Poona. I am grateful to Dr. R. Ananthakrishnan, Miss A.M. Mani and the staff of the Instruments Division of the Meteorological Office, Poona, without whose help the proper running and maintenance of the recording unit at Poona would not have been possible.

My thanks are due to Dr. S. G. Rastogi and Dr. J. S. Shirke for their advice and help during various stages of the work. I am grateful to Dr. S. K. Alurkar for his collaboration in the initial stages of the construction of the Radio Polarimeter and generally for his help and advice.

The theoretical calculations presented in the thesis have been carried out with the aid of the I.B.M. 1620 computer facility at the Physical Research Laboratory. I would like to express my gratitude to Mr. S. R. Thakore and the staff of the computing centre, in particular Mr. C. G. Rathod, Mr. I. V. Vayeda and Mr. P. S. Shah for the facilities and help which they placed at my disposal. I would also like to thank Miss N. J. Modi and Mr. J. G. Vora for helping to process the field-strength and polarization data.
My greatest debt is to Professor K.R. Ramanathan, under whom I have had the privilege of working throughout the period of investigation. His keen interest and enthusiasm have been a constant source of inspiration and I have learnt more from him than from anyone else.

(S. Ananthakrishnan)
