List of Figures

1.1 Light curve of Cepheid: Courtsey Google ........................................... 10
1.2 Light curve of RR Lyrae: Courtsey CRTS ........................................... 11
1.3 Light curve of δ-Scuti: Courtsey CRTS ............................................. 11
1.4 Light curve of dwarf novae: Courtsey CRTS ...................................... 13
1.5 Light curve of contact eclipsing binary: Courtsey CRTS ...................... 15
1.6 Light curve of semi detached eclipsing binary: Courtsey CRTS ............. 15
1.7 Light curve of detached eclipsing binary: Courtsey CRTS .................... 16

2.1 Time series data of 005759 + 0034.7: Courtesy ASAS2 ...................... 42
2.2 Published light curve of 005759 + 0034.7: Courtesy ASAS2 ................. 42
2.3 Light curve of 005759 + 0034.7 obtained from GLSP. The light curve misses one peak, compared to the Figure 2.2. PDM and SigSpec give similar light curves. ................................................. 43
2.4 The PDM Θ statistic of 005759+0034.7, the minimum is around 0.78 days ................................................................. 43
2.5 The GLSP periodogram of 005759 + 0034.7, the peak is around 0.8 days ............................................................................. 44
2.6 The SigSpec Significance of 005759 + 0034.7, the maximum is around 0.8 days ............................................................................. 44

3.1 Phased light curve of the RR Lyrae star 075021-0114.6, along with the modified cubic spline curve is plotted for the both published period 0.338760 days and newly detected period 0.513131 days. It is clear that newly detected period gives better light curve .................. 56

4.1 Light curve of the four stars 112422-6123.3, 112756-6123.6, 114127-6216.1 and 170022-2145.0, which are not published by ASAS in the a2perlc database .......................................................... 61
4.2 The newly detected periods and LC’s are entirely different from the published periods. ................................................................. 63
4.3 The newly detected periods are integral or half integral multiples of the published periods. ................................................................. 66
4.4 The light curves shown above are from the var3 database. Newly detected light curves are on the left and published light curves on the right. Periods in days are given at the top of each figure. The newly detected periods are entirely different from the published periods. . . 72
4.5 Newly detected light curves are on the left and published light curves are on the right. Periods in days are given at the top of each figure. All the above light curves are from the \textit{var3} database. It is found that the newly detected periods are harmonics of the published periods.  

5.1 Period improvement in the 5th decimal place. 

5.2 The above shown 44 light curves are obtained from the \textit{CRTS} database. The newly detected periods give better light curves than the published periods.
