CONTENTS

PART I
INTRODUCTION

1. Scope and Object of the Work 1
2. Review of the work done by earlier workers 1
  2.1 Theories and models on fission process 2
  2.2 Mass and charge distribution in fission 16
  2.3 Investigation of fission product gamma spectra and delayed neutron activity for fissile material identification and estimation 20
3. Present work 22

PART II
PRESENT WORK

Chapter 1
Model for Calculation of Probability of Division of a Fissioning Nucleus in Different Modes

1. Introduction 25
2. Order-Disorder Model 26
3. Fission as a rate process 28
  3.1 Basic observations 28
  3.2.1 Mathematical formulation 30
  3.2.1 Frequency factor 32
  3.2.2 Exponential energy dependent factor 35
4. Estimation of beta-stable neutron numbers 37
5. Balance neutrons 41
6. Computational procedure 42
7. Results and discussions 45
7.1 Total isotopic distributions 45

Chapter 2
Mass and Charge Distribution in Fission
1. Introduction 50
2. Isotopic distributions and computations of mass yield, total isotonic yield and charge distribution parameters 50
3. Results and Discussion 53
3.1 Fragment mass yield distribution 53
3.2 Total isotonic yield distribution 58
3.3 Charge distribution in fission 58

Chapter 3
Fissile Material Identification Techniques
1. Introduction 61
2. Experimental technique 62
3. Gamma spectra from fission products 62
4. Relative intensities of gammas in various energy groups 65
5. Investigation of delayed neutron activity relative to fission product gamma activity 68
6. Conclusion 71
