AIM AND OBJECTIVE

As there were many studies for pain after hernia surgery, they had variable results and etiology and there is lack of much data published from Indian subcontinent made me to further study the subject and there is a scope for research. The most commonly performed hernia surgery is open inguinal hernioplasty and therefor I decided to explore the Liechtenstein onlay hernioplasty.

I intend to study the hernioplasty with AIM of –

“Evaluation of pain and recurrence in patients of inguinal hernioplasty”

I intend to address Liechtenstein onlay hernioplasty with specific objectives as follows –

1. Study postoperative pain incidence and intensity in relation to age of patients, duration of hernia, type of hernia, extent of hernia etc.
2. Evaluate pain in relation to preoperative pain, inguinal nerves manipulation, cremaster skeletonization.
4. Find out other complications of hernia surgery.
5. Find recurrence of hernia surgery.
