## Contents

1 **Introduction.** 1

1.1 Lattice and band structure ................................. 2

1.2 Quantum Hall measurements ................................. 4

1.3 Outline of the thesis ...................................... 11

2 **Electric field effects on Landau levels in graphene.** 13

2.1 Cross electric and magnetic field ............................. 14

2.2 Numerical diagonalization of lattice model ...................... 20

2.3 Numerical solution for graphene lattice in magnetic field .... 24

2.4 Numerical solution for graphene lattice in cross electric and magnetic field 29

2.5 Dielectric breakdown ......................................... 33

2.6 Experimental probing breakdown ............................... 35

2.7 Summary .................................................. 36

3 **Interacting model for graphene** 37

3.1 Continuum approximation .................................... 39
3.2 Electron-electron interactions ........................................... 42
3.3 Zeeman term ................................................................. 45
3.4 Symmetries ................................................................. 45
3.5 Summary ................................................................. 48

4 Variational wave function .................................................. 49
4.1 Charge and spin ordering of $n = 0$ Landau level .................. 50
4.2 Landau levels for massive Dirac particle in graphene ............ 54
4.3 Variational states .......................................................... 56
  4.3.1 Parameterization for ground state at $\sigma_H = -1$ ............... 59
  4.3.2 Parameterization for ground state at $\sigma_H = 0$ ............... 60
4.4 Propagator for massive Dirac particle in presence of magnetic field .... 61
4.5 Two point correlation functions ........................................ 67
4.6 Summary ................................................................. 70

5 SU(4) symmetric model ..................................................... 71
5.1 Expectation value for symmetric model .............................. 72
  5.1.1 Kinetic term .......................................................... 72
  5.1.2 Coulomb term ........................................................ 74
5.2 Ground state energy minimization ...................................... 78
  5.2.1 Ground state at $\sigma_H = 0$ .................................... 78
  5.2.2 Ground state at $\sigma_H = -1$ ................................... 79
K.3  Ferromagnetic state  .................................................. 166
K.4  Canted state .............................................................. 168

L.  Excitations: $\sigma_H = -1$ ............................................. 171

  L.1  General expression for excitations  .............................. 171
  L.2  Valley and spin polarized state  ................................. 172
  L.3  Canted valley - Ferrimagnet  .................................... 175
