ACKNOWLEDGEMENTS

Many ideas and encouragements from several sources have gone into carrying out the present work. There are many who need to be acknowledged, but there are few who deserve special acknowledgement at a personal level.

With privilege, I express indebtedness to my supervisor Professor Saidul Zafar Qureshi Chairman, Department of Chemistry for his analytical thinking and ceaseless efforts, which made this work progressive. It was due to his organized methodology that developed in me a sense of sincerity and self-confidence. This made me familiar with related fields, which has really broadened the horizons.

I would like to accord special thanks to my esteemed teacher Dr. Nafisur Rehman for his feverest help during my research programme. He generously and graciously dispensed with innovative ideas in the form of suggestions.

With pleasure, I express gratitude to my colleagues Dr. Murad, Dr. Khyer, Abdullah. S. Ahmad, Nasrul Hoda, Najmul Hejaz and Nadeem Ahmad. I extend thanks to my friends Atta Ahmad, Sadat Kar, Anees Ahmad, Hassan Mohusein and Omar Basudan for always being alongside me through thick and thin.

A substantial amount of credit goes to my only sister, who put up with my long absence during my studies.

The research facilities of the department deserve the highest level of acknowledgement, that made charming an otherwise somber and a willy-nilly situation.

I am grateful to all the members of Anglo Computers for their herculean efforts in typing this thesis.
