List of Figures

2.1 Conventional temporal association learning process ................................ 19
3.1 Modified learning process of temporal association rules .......................... 30
3.2 Temporal FP-Tree .................................................................................. 35
3.3 Frequent pattern with prefix H ............................................................... 41
3.4 Frequent pattern with prefix C ............................................................... 42
3.5 A single prefix interval path that consist of two branch (I3, I1, I2) .......... 44
3.6 Frequent pattern in different interval .................................................... 47
3.7 Divide and Conquer method on the basis of time Database ..................... 50
3.8 H-struct, the hyper structure for storing frequent -item projection in specific first interval <*, 01,04> ................................................................. 51
3.9 H-struct, the hyper structure for storing frequent -item projection in specific second interval <*,06,04> ................................................................. 51
3.10 FP tree with different calendar time interval ........................................... 57
3.11 Lattice of item {A, B, C, D} ................................................................. 61
3.12 Lattice of temporal item {A, B, C, D } .................................................... 61
3.13 Enumeration tree .................................................................................. 65
3.14 Scalability on Transaction for dense dataset ........................................... 69
3.15 Scalability on transaction for sparse dataset .......................................... 70
3.16 Scalability for Dense dataset ............................................................... 71
3.17 Scalability for sparse dataset .............................................................. 72
3.18 Scalability on dataset PimaIndians.D42.N768.C2.num .......................... 73
3.19 Frequent patters from dataset PimaIndians.D42.N768.C2.num ............... 74
3.20 Memory usage from dataset .................................................................. 75
3.21 Scalability with threshold on dataset ................................................... 76
3.22 The memory usage for PimaIndian.D42.N768.C2.num dataset ............... 77
3.23 Nodes for finding frequent patterns ...................................................... 78
3.24 Computation of frequent patterns ......................................................... 79
3.25 Level of tree required to compute frequent patterns .............................. 80
3.26 Candidate generation time ................................................................... 81
LIST OF FIGURES

4.1 Tree after first split ........................................ 94
4.2 Tree split on second level class label attribute. .......... 95
4.3 After third level splitting of tree. .......................... 96
4.4 Segmentation of time dimension. .............................. 98
4.5 Decision Tree .................................................. 103
4.6 FP-tree on first calendar schema .............................. 108
4.7 Accuracy on agriculture data .................................. 110
4.8 Classification rules for wine.D68.N178.C3 data ............ 111
4.9 Classification rules for mushroom.D127.N8124.C2 dataset ... 112
4.10 Classification rule with support for wine.D68.N178.C3 .... 113
4.11 Accuracy on wine.D68.N178.C3 dataset .................... 114
4.13 Execution time ................................................ 116
4.14 Accuracy Chart ............................................... 117
4.15 Generated Rules ............................................... 118
4.16 Temporal vs non-temporal frequent sets .................... 119

5.1 Sliding window of size 8 ....................................... 127
5.2 Tilted time window with Quarter ................................ 131
5.3 Natural tilted time window .................................... 132
5.4 Logarithmic time scale ........................................ 134
5.5 Experiment result with Soybean data ......................... 142
5.6 Experimental result with hypo data set ..................... 143
5.7 Experimental result with crx data set ....................... 144

6.1 Two sequences with similar patterns. ........................ 150
6.2 Before mean value subtraction. The two sequences have similar patterns but their values may differ significantly. ............ 150
6.3 The Sub sequence matching problem can be converted into whole matching by sliding window of length n across the long sequence . 151
6.4 Example of Sub sequent Matching ............................ 151
6.5 Sub sequent the time series ................................... 152
6.6 After mean value subtraction .................................. 153
6.7 Normalized time series. ....................................... 154
6.8 Time series with segment ....................................... 155
6.9 Data reduction technique ...................................... 162
6.10 Aggregated data ............................................... 162
6.11 Time series with lower bound ................................. 163
6.12 The PAA representation of Fig. 6.11 A sequence of length 128 is reduced to 8 dimensions ........................................ 164
6.13 A normal probability plot of the cumulative distribution ........ 164
6.14 Symbolic Conversion of time series .................................. 166
6.15 Time Series from Chronological Data ................................. 167
6.16 PAA representation of time series ..................................... 167
6.17 Symbolic representation of above time series ....................... 168
6.18 Time Series from Chronobiological Dataset .......................... 168
6.19 PAA representation of time series ..................................... 169
6.20 Keogh Time series data pgt50_cdc15 .................................. 169
6.21 pgt50_cdc15 Window size vs. variation on Support & Confidence .. 170
A.1 Chronological development of temporal data mining ............... 191
