9. Future Directions

The findings of this thesis are fundamental, which can be utilised to develop equitable healthcare reimbursement schemes for the entire economic spectrum of the patient pool.

This would be a goal and will help in reaching the public healthcare facilities to all needy patients. The policy makers should realise the importance of pharmacoeconomics and its applications while framing budget allocations health sector.

There is no national level registry for cardiac diseases and many other conditions as a result of which the research carried out is based on physical collection of data. The government should join with professionals to establish national registry of cardiac patients, which will give an insight into trends, the burden of disease, and casualties. This data will direct the government to establish infrastructure to help the patients and also the human resources required to manage the patient load.
