<b>1</b>	<b>Introduction</b>	<b>3</b>
1.1	Notion of integrability . . . . .	4
1.2	Types of invariants . . . . .	8
1.2.1	Polynomial invariants . . . . .	8
1.2.2	Rational invariants . . . . .	9
1.2.3	Transcendental invariants . . . . .	9
1.3	Methods for construction of invariants . . . . .	10
1.3.1	Rationalization method . . . . .	11
1.3.2	Lie-algebraic approach . . . . .	12
1.3.3	Transformation group method . . . . .	13
1.3.4	Lutzky's approach . . . . .	14
1.3.5	Struckmeier and Riedel method . . . . .	14
1.3.6	Lax-Pair method . . . . .	15
1.3.7	Field method . . . . .	16
1.3.8	Prelle-Singer method . . . . .	18
1.3.9	Darboux integrability method . . . . .	19
1.3.10	Painlevé method . . . . .	20
1.4	Applications of invariants . . . . .	21
1.4.1	Integration by quadrature . . . . .	22
1.4.2	Invariants and Separability . . . . .	23
1.4.3	Cosmological applications . . . . .	25
1.4.4	Calculation of Feynman propagator . . . . .	26
1.4.5	Solutions of ordinary differential equations . . . . .	28
1.4.6	Invariants in quantum mechanics . . . . .	29

<b>2</b>	<b>Invariants in real space</b>	<b>31</b>
2.1	Construction of quadratic invariants . . . . .	32
2.1.1	Formalism . . . . .	32
2.1.2	Examples . . . . .	34
2.2	Construction of quartic invariants . . . . .	39
2.2.1	Formalism . . . . .	39
2.2.2	Examples . . . . .	42
<b>3</b>	<b>Invariants in complex <math>z\bar{z}</math> space</b>	<b>45</b>
3.1	Formalism . . . . .	46
3.1.1	Examples . . . . .	48
<b>4</b>	<b>Invariants in extended complex phase space</b>	<b>53</b>
4.1	Invariants using rationalization method . . . . .	54
4.1.1	Formalism . . . . .	55
4.1.2	Quartic invariants . . . . .	56
4.1.3	Cubic Invariants . . . . .	60
4.1.4	Quadratic invariants . . . . .	64
4.2	Invariants using Struckmeier and Riedel approach . . . . .	71
4.2.1	Formalism . . . . .	72
4.2.2	Quadratic invariants . . . . .	74
<b>5</b>	<b>Summary and conclusions</b>	<b>79</b>
5.1	Conclusions . . . . .	79
5.2	Future outlook . . . . .	81
	<b>Bibliography</b>	<b>81</b>
