List of Tables

Table 1: Change in forest cover in North East India from 2009 to 2011 .................... 6
Table 2: Species richness of the flowering plants in the North East India ............ 6
Table 3: List of major tribes, castes and other backward classes in the North East India. ........................................................................................................................8
Table 4: Queries with different complexities ............................................................ 58
Table 5: Results of different query parameters on the phytochemical collection .... 59
Table 6: Variation in query time in plants collection ............................................. 59
Table 7: Villages covered during the field survey .................................................... 66
Table 8: Disease Concepts of Meitei community in Jiribam and Imphal valley (pooled) ......................................................................................................................67
Table 9: Disease Concepts of Bengali community .................................................... 69
Table 10: Disease Concepts of Hmar community ................................................... 69
Table 11: Disease concepts of the Kuki community in Jiribam ............................... 70
Table 12: Informant Consensus Factor of different communities ........................... 71
Table 13: Liquid monoherbal recipes of the Meitei community in Jiribam and Imphal valley .................................................................................................................. 73
Table 14: Solid monoherbal recipes among the Meitei community in Jiribam and Imphal valley ........................................................................................................... 81
Table 15: Monoherbal recipes used through topical administration by the Meitei community in Jiribam and Imphal valley ................................................................. 85
Table 16: Monoherbal vapour based recipes among Meitei community in Jiribam and Imphal valley ........................................................................................................... 93
Table 17: Monoherbal recipes of the Bengali community in Jiribam ....................... 98
Table 18: Monoherbal recipes used by the Hmar community in Jiribam ............... 99
Table 19: Monoherbal recipes used by the Kuki community in Jiribam .................. 102
Table 20: Liquid based polyherbal recipes used through oral administration of Meitei community .................................................................................................................. 104
Table 21: Polyherbal solid recipes used by Meitei community in Jiribam and Imphal valley ................................................................................................................... 113
Table 22: Polyherbal recipes used through topical administration among Meitei community in Jiribam and Imphal valley ................................................................. 116
Table 23: Vapour-based polyherbal recipes used by the Meitei community in Imphal and Jiribam area .................................................................................................................. 120
Table 24: Polyherbal recipes of Bengali community in Jiribam ............................................. 123
Table 25: Polyherbal recipes of Hmar community in Jiribam .................................................. 124
Table 26: Polyherbal recipes of Kuki community in Jiribam ..................................................... 125
Table 27: Plants mentioned in the field study for use in ST Complex ...................................... 126
Table 28: Frequency of citation for plants used in Salai Taret Complex .................................. 127
Table 29: Linear regression models for number of medicinal species per family versus total number of species per family ........................................................................... 135
Table 30: Over-used and under-used plant families obtained by first regression approach .................................................................................................................. 136
Table 31: Significantly over-used and under-used plant families obtained by Binomial approach .................................................................................................................. 143
Table 32: Over-used and under-used families in Manipur obtained by Bayesian approach .................................................................................................................. 146
Table 33: IDM intervals for the medicinal plant species in Manipur ........................................ 148
Table 34: IDM intervals for the Medicinal flora of Manipur with different value of s. .............. 154
Table 35: Disease categories of Meitei community in Manipur ............................................. 155
Table 36: Drug-like and lead-like compounds with corresponding plants .............................. 179
Table 37: Summary of the physico-chemical properties of all filtered compounds, drug-like and lead-like compounds with various subsets ................................................ 183
Table 38: In silico mutagenicity and carcinogenicity results of the compound dataset .......... 186
Table 39: List of the compound included in the Super Toxic, Extremely Toxic and Very Toxic categories in the Oral Rat LD 50 test .................................................. 196
Table 40: Plants selected for species distribution modelling ................................................. 201
Table 41: Sources of the occurrence data used in the survey .................................................. 202
Table 42: Variables used in the species distribution modelling ............................................. 204
Table 43: Multi-collinearity test by using cross-correlation (Pearson correlation coefficients, r) among environmental variables ......................................................... 205
Table 44: AUC values of training data and test data .............................................................. 212
List of Figures

Figure 1: Map of North East showing eight states .......................................................... 5
Figure 2: Challenges and Issues in developing medicinal plant databases .................. 14
Figure 3: Conceptual framework for sharing local and regional knowledge with global resources .............................................................. 22
Figure 4: In the first option, put everything in a single document .................................. 35
Figure 5: Collections and relationship of documents in the current model ...................... 37
Figure 6: Approaches for online data collection ............................................................. 38
Figure 7: Workflow of data integration from multiple sources ........................................ 38
Figure 8: A section showing part of XSD file for mapping excel file to MongoDB compliant XML format .............................................................. 41
Figure 9: A sample plant document showing taxon and geographical extent .................. 43
Figure 10: Location data for a particular species ............................................................ 45
Figure 11: Phytochemical document for phenol ............................................................. 46
Figure 12: A snippet of disease collection ..................................................................... 47
Figure 13: A section of geographical collection ............................................................. 48
Figure 14: Ethnographic data for one community .......................................................... 48
Figure 15: One sample document for polyherbal recipe ............................................... 49
Figure 16: Bibliographical collection containing two different types of documents .......... 50
Figure 17: State-wise coverage of the medicinal plant species ....................................... 51
Figure 18: Frequency of articles in the journals that published more than one article about medicinal plants of North East India .......................................................... 52
Figure 19: Year versus journal articles surveyed for compiling the data ......................... 53
Figure 20: Data integration using Pentaho Data Integration tool .................................. 54
Figure 21: Screenshot of the Rockmongo tool showing data of the medicinal plant ......... 54
Figure 22: Screenshot of the page displaying plant list .................................................. 55
Figure 23: A screenshot of the prototype of the online version of the database showing details of the plant .............................................................................. 55
Figure 24: Screenshot of the online version showing phytochemical information .......... 56
Figure 25: A screenshot of the webpage enabling addition of new records (vernacular name) ........................................................................................................ 56
Figure 26: A screenshot showing aggregation of a sample data using ‘Scientific Name’ as a key. 57
Figure 27: Study site of primary field survey in Manipur. 62
Figure 28: Heatmap and cluster analysis by applying Jaccard distance. 128
Figure 29: Scatter diagram for the two principal axes of the results of principal coordinate analysis of the Salai Taret complex. 128
Figure 30: Residual plot of the overused and underused families of medicinal plants of Manipur. 142
Figure 31: Credible interval of over- and under-used medicinal plant families obtained from the Bayesian approach. 148
Figure 32: The 95% probability intervals obtained from the IDM for the medicinal flora of Manipur. 154
Figure 33: Heatmap of the disease category of the Meitei community and medicinal plant families in Manipur. 156
Figure 34: Cluster analysis among disease categories treated by medicinal species by Meitei community in Manipur. 157
Figure 35: Distribution of molecular weight among the total filtered dataset, drug-like and lead-like compounds. 163
Figure 36: Percentage of filtered compounds which violate Lipinski’s rule. 164
