# LIST OF FIGURES

<table>
<thead>
<tr>
<th>Figure</th>
<th>Description</th>
<th>Page No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Photograph showing a rhesus monkey (the animal model)</td>
<td>42</td>
</tr>
<tr>
<td>2</td>
<td>A typical course of <em>P. knowlesi</em> infection in rhesus monkeys. (NCM - normal course; CM - monkeys having cerebral malaria)</td>
<td>93</td>
</tr>
<tr>
<td>3</td>
<td>Photomicrograph of a blood smear from an infected monkey showing rings and early trophozoite stages of the parasite (x 1000)</td>
<td>94</td>
</tr>
<tr>
<td>4</td>
<td>Photomicrograph showing segmenter and schizont stages of the parasite (x 1000)</td>
<td>95</td>
</tr>
<tr>
<td>5</td>
<td>Photomicrograph showing parasitic infiltration of cerebellum (H &amp; E x 200)</td>
<td>98</td>
</tr>
<tr>
<td>6</td>
<td>Photomicrograph showing parasitic infiltration of capillary endothelial cells of cerebrum (H &amp; E x 200)</td>
<td>99</td>
</tr>
<tr>
<td>7</td>
<td>Photomicrograph showing parasite deposits in cerebrum (H &amp; E x 40)</td>
<td>100</td>
</tr>
<tr>
<td>8</td>
<td>Photomicrograph showing a capillary of mid-brain studded with parasitized RBCs (H &amp; E x 100)</td>
<td>101</td>
</tr>
<tr>
<td>9</td>
<td>Photomicrograph showing parasitic infiltration in the meningeal lining of cerebellum (H &amp; E x 100)</td>
<td>102</td>
</tr>
<tr>
<td>10</td>
<td>Photomicrograph showing parasitic invasion of meninges (H &amp; E x 40)</td>
<td>103</td>
</tr>
<tr>
<td>11</td>
<td>Photomicrograph showing granuloma comprising of parasitized macrophages in cerebrum (H &amp; E x 100)</td>
<td>104</td>
</tr>
<tr>
<td>12</td>
<td>Photomicrograph showing numerous malarial parasites in capillary endothelial cells of cerebellum (H &amp; E x 1000)</td>
<td>105</td>
</tr>

</table>
Figure 13. Photomicrograph showing parasitic infiltration of a glial cell of cerebrum (H & E x 200)

Figure 14. Photomicrograph showing parasite invasion of spinal cord (H & E x 200)

Figure 15. Electronmicrograph showing parasitized and un-parasitized erythrocytes (x 1600)

Figure 16. Electronmicrograph showing parasitized RBC. Note the presence of a platelet (P) and a RBC having degenerated parasites (dp) (x 2,400)

Figure 17. Electronmicrograph showing malaria parasite and RBC in capillary lumen. The presence of a merozoite (m) is shown in close proximity of the RBC (x 14,000)

Figure 18. Electronmicrograph showing formation of merozoites in a RBC (x 31,000)

Figure 19. Electronmicrograph showing parasitized RBCs (p) and unparasitized erythrocytes in vascular lumen of cerebellum (x 19,000)

Figure 20. Electronmicrograph showing parasitized and unparasitized RBCs in a vessel lumen of cerebrum. The enlarged nucleus of the endothelial cell (N) can be observed (x 16,000)

Figure 21. Electronmicrograph showing a parasitized erythrocyte attached to the endothelial cell (x 24,000)

Figure 22. Ependymal lining of choroid plexus. Note the presence of well developed microvilli, numerous varying shaped mitochondria (M), long profiles of rough endoplasmic reticulum (RER), ovoid shaped nucleus (N), numerous collagen bundles (C) and fibroblast (F) and blood vessel (BV) (x 2,400)

Figure 23. Magnified view of the figure 22. Note the presence of mitochondria with high electron density matrix and a few lipofuscin pigments (L) (x 7,100)
Figure 24. Cross section of choroid plexus. Note the presence of a macrophage (M) in the vessel lumen along with numerous parasitized erythrocytes (P) (x 19,000)

Figure 25. Electronmicrograph showing a macrophage attached to the endothelial cell lining, few parasitized RBCs (P) are present in the vessel lumen (x 3,000)

Figure 26. Parasitized RBC present in the proximity of a macrophage (x 13,000)

Figure 27. Magnified view of a macrophage exhibiting numerous plasma membrane infoldings and lysosomes at varying developmental stages. A platelet could be seen in close proximity of the macrophage (x 7,100)

Figure 28. Electronmicrograph showing autophagosomes having different degenerated stages of the parasite (x 16,900)

Figure 29. Electronmicrograph showing parasitized erythrocyte in vessel lumen. Note the presence of numerous mitochondria (M) and lipofuscin pigment (L) (x 7,100)

Figure 30. Photomicrograph from cerebellum of mouse brain showing plugging of a capillary by parasitized erythrocytes (H & E x 200)

Figure 31. Photomicrograph from cerebellum showing parasitic infiltration in mouse brain (H & E x 40)

Figure 32. Photomicrograph from cerebrum showing parasitic infiltration in mouse brain (H & E x100)

Figure 33. Photomicrograph from sclera showing parasitized RBCs in a sub-epithelial capillary (H & E x 100)

Figure 34. Photomicrograph of a section from choroid showing parasite deposits (H & E x 200)
Figure 35. Photomicrograph showing parasitic infiltration of a retinal blood vessel (H & E x 100) 140

Figure 36. Magnified view of the figure 35 (H & E x 400) 141

Figure 37. Electronmicrograph showing occlusion (O) of a retinal blood vessel by parasitized erythrocytes (PE). Note the attachment of infected erythrocytes to the capillary endothelial cells (x 12,910) 142

Figure 38. Electronmicrograph at a higher magnification showing occluded blood vessel by parasitized erythrocytes (x 31,000) 143

Figure 39. Photomicrograph showing an infected blood smear made after leukocyte removal (x 1,000) 144

Figure 40. Photomicrograph showing an infected blood smear made after saponin treatment (x 1,000) 146

Figure 41. Photomicrograph showing disrupted _P. knowlesi_ parasites after sonication (x 1000) 147

Figure 42. Polyacrylamide gel electrophoresis showing:
   a) Normal monkey RBC proteins
   b) _P. knowlesi_ parasites obtained after electrophoresis 149

Figure 43. Photomicrograph showing parasite clearance from a post-treated monkey (x 1000) 150

Figure 44. Photograph showing the appearance of a delayed type skin hypersensitivity reaction 156

Figure 45. Course of _P. knowlesi_ infection in the post challenge period 159

Figure 46. Humoral Immune Response during post challenge period 162

Figure 47. Cell Mediated Immune Response during post challenge period 163
Figure 48. Section from liver showing dilated central vein, hepatocytes and sinusoids. Malarial pigment can be seen in the central vein and sinusoids. Hepatocytes are free from pigment. There is necrosis of some hepatocytes around the central vein (H & E x 100)

Figure 49. Higher magnification showing pigment in the central vein and in the sinusoids (H & E x 400)

Figure 50. Section from the liver showing cords of hepatocytes separated by sinusoids. The sinusoids show presence of large amount of pigment engulfed within Kupffer cells and macrophages. Hepatocytes are normal (H & E x 200)

Figure 51. Section of liver showing pigment free central vein and sinusoids (H & E x 200)

Figure 52. Hepatic sinusoids showing absence of pigment and compressed Kupffer cells lying within the sinusoids in higher magnification (H & E 400)

Figure 53. Section from spleen showing pigment deposits in the red pulp (H & E x 100)

Figure 54. Section from spleen showing thickened splenic capsule, the red and the white pulp. The red pulp is filled with pigment while the white pulp (Malpigian corpuscle) is devoid of pigment (H & E x 40)

Figure 55. Section from spleen showing pigment free red pulp, hyperplastic white pulp and trabeculae (H & E x 40)

Figure 56. Red pulp of spleen showing RBC devoid of parasite pigment in higher magnification (H & E x 400)

Figure 57. Section from kidney showing a single glomerulus having malarial pigment within its capillaries in higher magnification (H & E x 400)
Figure 58. Section from kidney showing presence of pigment in the glomerular capillaries and also in the region of the tubules. The tubules show cloudy swelling and marked degenerative changes (H & E x 100)

Figure 59. Section from kidney showing glomeruli, tubules and a blood vessel. The glomerular capillaries and the RBC within the blood vessel showing no parasite. The tubules however, show cloudy swelling (H & E x 100)

Figure 60. Section from kidney at a higher magnification showing pigment free glomeruli. Tubules show cloudy swelling (H & E x 400)

Figure 61. Section from cerebellum showing blood vessels filled with parasitized RBCs (H & E x 100)

Figure 62. A complete plugging of a blood vessel with pigmented RBC in higher magnification (H & E x 400)

Figure 63. Section from cerebellum showing a blood vessel containing normal RBC (pigment free) (H & E x 200)

Figure 64. Section from cerebellum showing parasite free RBCs in a blood vessel (H & E x 200)

Figure 65. Section from cerebrum showing numerous blood vessels containing parasitized RBCs (H & E x 100)

Figure 66. A blood vessel in the cerebrum showing parasitized RBCs in higher magnification (H & E x 400)

Figure 67. Section from cerebrum showing parasite free RBCs (H & E x 100)
