CONTENTS

I. INTRODUCTION 1 - 5

II. MATERIALS AND METHODS 6 - 16

III. EXPERIMENTAL RESULTS

1. Survey of Tylenchorhynchus brassicae. 17 - 19

2. Host range and pathogenicity of T. brassicae. 20 - 31

3. Effect of different levels of inoculum of T. brassicae on the growth of cabbage and cauliflower. 32 - 38

4. Studies on the effect of soil temperature on the multiplication of T. brassicae on cabbage and cauliflower. 39 - 41

5. Studies on the effect of soil moisture on the multiplication of T. brassicae on cabbage and cauliflower. 42 - 43

6. Survival of T. brassicae at different soil temperatures and moisture levels in the absence of host. 44 - 48

7. Fluctuations in the population of T. brassicae as influenced by crop rotation for the period March 1966 to February 1968, in field A and field B. 49 - 52

8. Distribution of males, females and larvae of T. brassicae at different depths. 53 - 55

10. Effect of different dilutions of certain pesticides on the mortality of T. brassicae.

11. Raising the seedlings of cabbage and cauliflower in DD or Vapam treated and autoclaved soil and later transferring them to infested field to determine the changes in population of T. brassicae around the roots and growth of plants.

12. Population changes of T. brassicae and growth of cabbage and cauliflower as influenced by the application of neem, mahua, groundnut, mustard and castor oilcakes.

13. Effect of incorporating organic additives in infested soil to study the survival of T. brassicae in the absence of host.

14. Effect of different dilutions of oilcakes on the mortality of T. brassicae.

IV DISCUSSION AND CONCLUSION

V. LITERATURE CITED
