LIST OF TABLES i-iii
LIST OF FIGURES AND GRAPHS iv-vi
LIST OF ABBREVIATIONS vii-ix

1. INTRODUCTION 1-15
   1.1 Evolution and significance of Sepsis 1
   1.2 Spectrum of Sepsis 2
   1.3 Pathophysiology of sepsis 3
   1.4 Pathophysiology of Oxidative stress in Sepsis 4
   1.5 Markers in Sepsis
      1.5.1 Established haematological markers and C-reactive protein (CRP) 7
      1.5.2 Proposed Biochemical markers of sepsis 9
   1.6 Strategies to enhance endogenous antioxidants Scope 12
   1.7 Hypothesis 14
   1.8 Scope 14
   1.9 Aims and objectives 15

2. REVIEW 16-41
   2.1 Haematological markers 16
   2.2 Biochemical markers 17
      2.2.1 Proposed biomarkers in sepsis 17
      2.2.2 C-reactive protein 27
   2.3 Severity of sepsis 31
   2.4 Effect of antioxidant drugs on biomarkers of sepsis 34

3. MATERIAL & METHODS 42-51
   3.1 Place of study 42
   3.2 Materials:
      3.2.1 Sample size 42
      3.2.2 Selection criteria 42
      3.2.3 Exclusion criteria 42
      3.2.4 Group division 43
      3.2.5 Collection of sample 43
   3.3 Methods:
3.3.1 Estimation methods of anti-oxidant enzymes 45
3.3.2 Materials for enzymes assays 45
3.3.3 Lactate dehydrogenase 46
3.3.4 Assay of enzymatic antioxidant parameters 46
3.3.5 Assay of non-enzymatic antioxidant parameters 47
3.4 Blinding of study 49
3.5 Statistical analysis 50

4. CHAPTER – I: 52-64

Comparison of demographic profile between normal control and sepsis patients and between the groups and their influence on the sepsis markers if any.

4.1 – General Introduction 53
4.2 – Study design 53
4.3 – Results 54

4.3.1 Section – A: Comparison between male and female patients in different groups. 54
4.3.2 Section – B: Comparison between age of the patients in different groups. 57
4.3.3 Section – C: Comparison between the weights of the patients in different groups. 60

4.4 – Discussion 63

5. CHAPTER – II: 65-91

Comparison of the haematological and biochemical markers between normal control and sepsis patients

5.1 – General Introduction 65
5.2 – Study design 66
5.3 – Results 66

5.3.1 Section A: The comparison of haematological markers between normal control and sepsis patients 66
5.3.2 Section B: The comparison of biochemical markers (proposed biomarkers and serum CRP) between normal control and sepsis patients 69
5.3.3 Section C: Evaluation of the change in the haematological and biochemical markers between normal control and sepsis patients

5.4 – Discussion

6. CHAPTER – III:

Evaluation of correlation between sepsis markers (haematological and biochemical) and severity of sepsis and the most significant predictable markers amongst all the markers

6.1 – General Introduction

6.2 – Study design

6.3 – Results

6.3.1 Section A: Correlation between the clinical severity (APACHE II score) of sepsis and sepsis markers (haematological and biochemical)

6.3.2 Section B: Correlation between the severity of sepsis of different grades (APACHE II score < 10 and ≥ 10) and sepsis markers.

6.4 Discussion

7. CHAPTER – IV:

The effect of the external source of antioxidants, N-acetylcysteine and vitamin C on the studied markers of sepsis and the most effective antioxidant drug or combination of drugs in reducing the level of markers.

7.1 – General Introduction

7.2 – Study design

7.3 – Results

7.3.1 Section A: Comparison between preoperative level and postoperative day 1 level of haematological and biochemical markers of sepsis in different groups

7.3.2 Section B: Comparison between post operative day 1 and day 4 level of haematological and biochemical markers in different groups

7.3.3 Section C: The effect of antioxidant drugs on the haematological and biochemical markers in different groups
7.4 - Discussion 154
8. SUMMARY AND CONCLUSION 165-173
9. BIBLIOGRAPHY 174-191
10. PROFORMA x-xii
11. MASTER CHART xiii-xxv
12. BIOGRAPHY xxvi-xxix
