LIST OF THE TABLES

1. Showing the incidence of embryo-lethal and teratogenic effects induced by mercury in developing chick embryo on 18th day.

2. Showing the range and frequency of the external malformation induced by mercury in developing chick embryo.

3. Showing the anomalies of the internal organs induced by mercury in developing chick embryo.

4. Showing the incidence of embryo-lethal and teratogenic effects induced by lead in developing chick embryo on 18th day.

5. Showing the range and frequency of the external malformations induced by lead in developing chick embryo.

6. Showing the anomalies of the internal organs induced by lead in developing chick embryo.

7. Showing the incidence of embryo-lethal and teratogenic effects induced by arsenic in developing chick embryo on 18th day.

8. Showing the range and frequency of the external malformation induced by arsenic in developing chick embryo.

9. Showing the anomalies of the internal organs induced by arsenic in developing chick embryo.

10. Showing the incidence of embryo-lethal and teratogenic effects induced by zinc in developing chick embryo on 18th day.
11. Showing the range and frequency of the external malformations induced by zinc in developing chick embryo.

12. Showing the anomalies of the internal organs induced by zinc in developing chick embryo.

13. Showing the comparison of lethal and teratogenic effects induced by mercury, lead, arsenic and zinc.

14. Showing the changes in collagen tissue and glycogen after treatment with mercury, lead, arsenic and zinc.

15. Showing the changes in alkaline phosphatase, acid phosphatase, and DNA/RNA.
