CHAPTER III

Results

The obtained data were scored, grouped and analyzed both in terms of parametric as well as non-parametric statistics to see whether they supported the underlying assumptions and hypotheses. At the same time, care was taken to make sure that the meaning of the data was not lost in the process of its numerical transformation, classification and organization.

3.1. Age

3.1.a. Effect of age on ego identity.

Table 4

Means and Standard Deviations of Ego Identity Scores for the two age groups

<table>
<thead>
<tr>
<th>Age</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16 years</td>
<td>600</td>
<td>6.92</td>
<td>2.03</td>
</tr>
<tr>
<td>17-18 years</td>
<td>600</td>
<td>6.98</td>
<td>2.03</td>
</tr>
</tbody>
</table>

In table 4, the test of least significant difference...
(t = 0.21, df = 1152, NS) reveals that the younger (M = 6.92) and older (M = 6.98) subjects do not differ in their ego identity.

3.1.b. **Effect of age on purpose-in-life.**

**Table 5**

**Means and Standard Deviations of Purpose-in-Life Scores for the two age groups**

<table>
<thead>
<tr>
<th>Age</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16 years</td>
<td>600</td>
<td>103.07</td>
<td>18.73</td>
</tr>
<tr>
<td>17-18 years</td>
<td>600</td>
<td>101.83</td>
<td>16.72</td>
</tr>
</tbody>
</table>

In table 5, the test of least significant difference (t = 1.81, df = 1152, NS) indicates that younger (M = 103.07) and older (M = 101.83) subjects do not differ in their purpose-in-life.

3.1.c. **Relationship between age and present self-concept.**

Chi-square analysis (see table 6) revealed a non-significant relationship between age and present self-concept. Table 6 gives the proportion (in %) of each age group expressing positive, negative or neutral responses for items related to the present self.
Table 6

Proportions of Each Age Group Expressing Themes Having To Do with Present Self (in %)

Sentence 1: "When I think about myself ..."

<table>
<thead>
<tr>
<th>Age</th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16</td>
<td>55.82</td>
<td>31.12</td>
<td>12.98</td>
</tr>
<tr>
<td>17-18</td>
<td>54.04</td>
<td>32.19</td>
<td>13.60</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 1.36, \text{NS} \]

Sentence 2: "Other people do not realize that I ..."

<table>
<thead>
<tr>
<th>Age</th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16</td>

<td>19.15</td>
<td>44.10</td>
</tr>
<tr>
<td>17-18</td>
<td>36.44</td>
<td>21.59</td>
<td>41.80</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 2.23, \text{NS} \]

Sentence 3: "Now and again I realize that I ..."

<table>
<thead>
<tr>
<th>Age</th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16</td>
<td>57.26</td>
<td>31.25</td>
<td>11.32</td>
</tr>
<tr>
<td>17-18</td>
<td>55.96</td>
<td>28.32</td>
<td>15.37</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 5.26, \text{NS} \]
Sentence 1: "When I think about myself...
A high percentage of younger subjects (55.82) held a positive self-image whereas a high percentage of older subjects (32.19) held a negative self-image.

Sentence 2: "Other people do not realize that I...
Highest percentage of younger subjects (44.10) fell into the neutral category. Younger (36.75) and older (36.44) subjects were more or less equal in their positive self-image. Higher percentage of older subjects (21.59) held a negative view of the self.

Sentence 3: "Now and again I realize that I...
Positive self-image was held by highest percentage of younger (57.26) and older (55.96) subjects. Higher percentage of younger subjects (31.25) when compared to the older subjects (28.32) held a negative self-image. Higher percentage of older subjects (15.37) were neutral in their self-image.

Chi-square analysis (see table 7) revealed a non-significant relationship between age and future self-concept. Table 7 also gives the proportion (in %) of each age group expressing positive, negative or neutral responses to items related to the future self.
Table 7

Proportions of Each Age Group Expressing Themes Having To Do with Future Self (in %)

Sentence 1: "If I think about when I am older ..."

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>15-16</td>
<td>36.07</td>
<td>39.77</td>
<td>24.16</td>
</tr>
<tr>
<td>17-18</td>
<td>34.18</td>
<td>44.44</td>
<td>21.21</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 3.97, \text{NS} \]

Sentence 3: "Sometimes the future seems ..."

<table>
<thead>
<tr>
<th>Age</th>
<th>Positive View</th>
<th>Negative View</th>
<th>Neutral View</th>
</tr>
</thead>
<tbody>
<tr>
<td>15-16</td>
<td>38.19</td>
<td>44.56</td>
<td>17.09</td>
</tr>
<tr>
<td>17-18</td>
<td>38.37</td>
<td>46.52</td>
<td>14.94</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 3.11, \text{NS} \]
Sentence 1: "If I think about when I'm older..."
Positive self-image was held by highest percentage of older subjects (64.40) whereas negative self-image was held by a high percentage of younger subjects.

Sentence 2: "For me the most worrying thing is..."
High percentage of older subjects were (44.44) concerned with future issues whereas high percentage of younger subjects were concerned with present (36.07) and abstract issues (24.16).

Sentence 3: "Sometimes the future seems...
Negative view of the future was held by a high percentage of older (46.52) and younger subjects (44.56). More or less equal percentage of younger (38.19) and older subjects (38.37) held a positive view of their future.

3.2. Sex Differences

3.2.a. Effect of sex differences on ego identity.

Table 8
Means and Standard Deviations of Ego Identity Scores for Boys and Girls

<table>
<thead>
<tr>
<th>Sex</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>600</td>
<td>7.09</td>
<td>1.83</td>
</tr>
<tr>
<td>Girls</td>
<td>600</td>
<td>6.81</td>
<td>2.21</td>
</tr>
</tbody>
</table>

76
In table 8, the test of least significant difference 
(t = 0.21, df = 1152, p < .05) reveals that boys (M = 7.09) are 
significantly higher in their ego identity than girls (M = 6.81).

3.2.b. Effect of sex differences on purpose-in-life.

Table 9

Means and Standard Deviations of Purpose-in-Life Scores for Boys and Girls

<table>
<thead>
<tr>
<th>Sex</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>600</td>
<td>102.68</td>
<td>17.03</td>
</tr>
<tr>
<td>Girls</td>
<td>600</td>
<td>102.22</td>
<td>18.46</td>
</tr>
</tbody>
</table>

In table 9, the test of least significant difference 
(t = 1.81, df = 1152, NS) reveals that boys (M = 102.68) and 
girls (M = 102.22) do not differ significantly in their 
purpose-in-life.

3.2.c. Relationship between sex and present self-concept.

Chi-square analysis (see table 10) revealed a non-
significant relationship between sex of the subject and present 
self-concept. Table 10 also gives the proportion (in %) of boys 
and girls expressing positive, negative or neutral responses to 
items related to the present self.

77
Table 10

**Proportions of Boys and Girls Expressing Themes Having To Do with Present Self (in %)**

**Sentence 1:** "When I think about myself ...

<table>
<thead>
<tr>
<th></th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>

<td>14.21</td>
</tr>
<tr>
<td>Girls</td>
<td>56.09</td>
<td>31.39</td>
<td>12.35</td>
</tr>
</tbody>
</table>

\[X^2 (2, N = 1200) = 2.09, \text{NS}\]

**Sentence 2:** "Other people do not realize that I ...

<table>
<thead>
<tr>
<th></th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>37.18</td>
<td>16.52</td>
<td>46.30</td>
</tr>
<tr>
<td>Girls</td>
<td>36.02</td>
<td>24.19</td>
<td>39.62</td>
</tr>
</tbody>
</table>

\[X^2 (2, N = 1200) = 2.51, \text{NS}\]

**Sentence 3:** "Now and again I realize that I ...

<table>
<thead>
<tr>
<th></th>
<th>Positive self-image</th>
<th>Negative self-image</th>
<th>Neutral</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>55.80</td>
<td>30.38</td>
<td>13.65</td>
</tr>
<tr>
<td>Girls</td>
<td>57.44</td>
<td>29.23</td>
<td>12.99</td>
</tr>
</tbody>
</table>

\[X^2 (2, N = 1200) = 3.36, \text{NS}\]
Sentence 1: "When I think about myself..."
Positive self-image was held by a high percentage of girls (56.09) and boys (53.81). Negative self-image was held by more or less equal percentage of boys (31.98) and girls (31.39).

Sentence 2: "Other people do not realize that I...
A high percentage of boys (46.30) and girls (39.62) fell into the neutral category. Positive self-image was held by a high percentage of boys (37.18) and negative self-image was held by a high percentage of girls (24.19).

Sentence 3: "Now and again I realize that I...
Positive image was held by a high percentage of girls (57.44) and boys (55.80). Negative image was held by a high percentage of boys (24.19).

3.2.d. Relationship between sex and future self-concept.

Chi-square analysis (see table 11) revealed a non-significant relationship between sex of the subject and future self-concept. Table 11 also gives the proportion (in %) of boys and girls expressing positive, negative or neutral responses to items related to the future self.

Sentence 1: "If I think about when I'm older..."
Positive self-image was held by a high percentage of boys (63.45) and negative self-image was held by high percentage of girls.
Table 11

Proportions of Boys and Girls Expressing Themes Having To Do with Future Self (in %)

Sentence 1: "If I think about when I am older ..."

<table>
<thead>
<tr>
<th>Sex</th>
<th>Positive view</th>
<th>Negative view</th>
<th>Neutral view</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>63.45</td>
<td>20.81</td>
<td>15.74</td>
</tr>
<tr>
<td>Girls</td>
<td>57.89</td>
<td>24.79</td>
<td>17.15</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 4.91, \text{NS} \]

Sentence 2: "For me the most worrying thing is ..."

<table>
<thead>
<tr>
<th>Sex</th>
<th>Present issues</th>
<th>Future issues</th>
<th>Abstract issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>33.95</td>
<td>44.03</td>
<td>22.02</td>
</tr>
<tr>
<td>Girls</td>
<td>36.30</td>
<td>40.17</td>
<td>23.36</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 2.76, \text{NS} \]

Sentence 3: "Sometimes the future seems ..."

<table>
<thead>
<tr>
<th>Sex</th>
<th>Positive view</th>
<th>Negative view</th>
<th>Neutral view</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boys</td>
<td>36.26</td>
<td>48.90</td>
<td>14.84</td>
</tr>
<tr>
<td>Girls</td>
<td>40.30</td>
<td>42.16</td>
<td>17.20</td>
</tr>
</tbody>
</table>

\[ X^2 (2, N = 1200) = 4.96, \text{NS} \]
Sentence 2: "For me the most worrying thing is..."
Higher percentage of boys (44.03) were concerned with the future issues while higher percentage of girls (36.30) were concerned with the present issues.

Sentence 3: "Sometimes the future seems..."
Negative view of the future was held by a high percentage of boys (48.90) whereas positive view of the future was held by a higher percentage of girls (40.30).

3.3. Sex Roles

3.3.a. Effect of sex roles on ego identity.

Table 12
Means and Standard Deviations of Ego Identity Scores for the Four Sex Role Groups

<table>
<thead>
<tr>
<th>Sex Role</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Androgynous</td>
<td>388</td>
<td>7.57</td>
<td>1.81</td>
</tr>
<tr>
<td>Masculine</td>
<td>241</td>
<td>7.35</td>
<td>2.14</td>
</tr>
<tr>
<td>Feminine</td>
<td>241</td>
<td>6.63</td>
<td>2.07</td>
</tr>
<tr>
<td>Undifferentiated</td>
<td>330</td>
<td>6.16</td>
<td>1.85</td>
</tr>
</tbody>
</table>

In table 12, the test of least significant difference ($t = 0.40$, df = 1152, $p < .01$) indicates that androgynous subjects ($M = 7.57$) are significantly higher in their ego identity followed respectively by masculine ($M = 7.35$), feminine
(M = 6.63) and undifferentiated (M = 6.16) subjects.

3.3.b. Effect of sex roles on purpose-in-life.

Table 13

Means and Standard Deviations of Purpose-in-Life Scores for the Four Sex Role Groups

<table>
<thead>
<tr>
<th>Sex Role</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Androgynous</td>
<td>388</td>
<td>109.72</td>
<td>15.80</td>
</tr>
<tr>
<td>Masculine</td>
<td>241</td>
<td>105.92</td>
<td>15.57</td>
</tr>
<tr>
<td>Feminine</td>
<td>241</td>
<td>100.17</td>
<td>16.14</td>
</tr>
<tr>
<td>Undifferentiated</td>
<td>330</td>
<td>93.03</td>
<td>18.02</td>
</tr>
</tbody>
</table>

In table 13, the test of least significant difference (t = 3.37, df = 1152, p < .01) indicates that the difference between the mean scores of all four sex roles categories is statistically significant at .01 level. Androgynous subjects (M = 109.72) are significantly higher in their purpose-in-life followed by masculine (M = 105.92), feminine (M = 100.17) and undifferentiated subjects (M = 93.03).

3.3.c. Relationship between sex roles and present self-concept.

Chi-square analysis (see table 14) revealed a significant relationship between sex roles and all the three items related to the present self-concept. Table 14 also gives the proportion (in
% of each sex role group expressing positive, negative or neutral responses to items related to the present self.

**Sentence 1:** "When I think about myself..."
Positive self-image was held by the highest percentage of androgynous (63.19) subjects followed by masculine (59.57), feminine (51.28) and undifferentiated (44.41) subjects. The reverse is true for negative self image.

**Sentence 2:** "Other people do not realize that I..."
A high percentage of undifferentiated subjects (44.38) and equal percentage of androgynous (42.97) and masculine (42.98) subjects fell into the neutral category. Positive self-image was held by a high percentage of masculine (41.28) and androgynous (40.32) subjects. Negative self-image was held by a high percentage (25.94) of undifferentiated subjects.

**Sentence 3:** "Now and again I realize that I..."
Positive self-image was held by the highest percentage of androgynous (60.70) and masculine (60.76) subjects. Negative self-image was held by highest percentage of undifferentiated (38.34) and lowest percentage of androgynous subjects (24.86). Lowest percentage of feminine (9.83) subjects fell into the neutral category.
Table 14

</tbody>
</table>

\[ X^2 (6, \, N = 1200) = 31.81, \, p < .01 \]
3.3.d. Relationship between sex roles and future self-concept.

Chi-square analysis (see table 15) revealed a significant relationship between sex roles and two of the three items related to the future self. Table 15 also gives the proportion (in %) of each sex role group expressing positive, negative or neutral responses to items related to the future self.

Sentence 1: "If I think about when I'm older..."
Positive view was held by the highest percentage of androgynous (65.88) subjects, followed respectively by masculine (61.60), feminine (58.40) and undifferentiated (55.55) subjects. Negative view was held by the highest percentage of feminine (27.73) and undifferentiated (27.16) subjects. Lowest percentage of feminine (13.87) subjects held neutral view.

Sentence 2: "For me the most worrying thing is..."
Highest percentage of undifferentiated (45.09) subjects and lowest percentage of androgynous (M = 39.58) subjects were concerned with their future. High percentage of feminine (39.00) and androgynous (37.24) subjects were concerned with the present.

Sentence 3: "Sometimes the future seems..."
Negative view of the future was held by highest percentage of undifferentiated (56.58) and lowest percentage of androgynous (35.79) subjects. The reverse is true for a positive view of the future i.e. positive view of the future was held by highest
Table 15

<td>28.74</td>
<td>56.58</td>
<td>14.68</td>
</tr>
</tbody>
</table>

$X^2 (6, N = 1200) = 49.94, p < .01$
percentage of androgynous (49.21) and lowest percentage of undifferentiated (28.75) subjects. Highest percentage of masculine (20.08) subjects were neutral about their future.

3.4. Social Class

3.4.a. Effect of social class on ego identity.

Table 16

Means and Standard Deviations of Ego Identity Scores for the Three Social Classes

<table>
<thead>
<tr>
<th>Social Class</th>
<th>n</th>
<th>Mean</th>
<th>SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper</td>
<td>400</td>
<td>7.46</td>
<td>2.21</td>

</table>

In table 17, the test of least significant difference \( t = 2.92, \text{df} = 1152, p < .01 \) indicates that upper class subjects \( M = 107.45 \) have a significantly higher purpose-in-life than middle \( M = 102.93 \) and lower class subjects \( M = 96.97 \) respectively.

3.4.c. **Relationship between social class and present self-concept.**

Chi-square analysis (see table 18) revealed a significant relationship between social class and the present self. Table 18 also gives the proportion (in %) of each social class expressing positive, negative or neutral responses to items related to the present self.

**Sentence 1:** "When I think about myself..."

Positive self-image was held by highest percentage of upper class..."

future self.

Sentence 1: "If I think about when I'm older..."
Positive view was held by highest percentage of middle class subjects (65.99) followed by upper (60.05) and lower class (55.98) subjects respectively. Negative view was held by a high percentage of lower class (27.99) subjects.

Sentence 2: "For me the most worrying thing is..."
Highest percentage of upper class (44.72) subjects were concerned with the future, higher percentage of middle class subjects (37.69) were concerned with the present and higher percentage of lower class (28.68) subjects were concerned with abstract issues.

Sentence 3: "Sometimes the future seems..."
A negative view of the future was held by highest percentage of lower class (55.84) subjects followed by middle (42.64) and upper class (38.19) subjects. A positive view of the future was held by a high percentage of upper class subjects (46.73) whereas highest percentage of middle class (19.78) subjects were neutral about their future.
3.5. Interaction effects

3.5.a. Effect of age, sex, sex roles and social class on ego identity.

Table 20 reveals the means and standard deviations of ego identity scores for age, sex, sex roles and social class.

Table 20 indicates that androgynous girls from upper (M = 8.43), middle (M = 7.64) and lower (M = 7.19) class in the younger age group have higher ego identity mean scores than boys. In the older age group, androgynous boys (M = 7.20) and girls (M = 7.22) from lower class do not differ in their ego identity. Androgynous girls (M = 7.64) from the middle class are higher in their ego identity than their counterpart boys (M = 6.83) in the older age group. Upper class (M = 8.03) androynous boys in the older age group have higher mean scores than girls (M = 7.82).

Masculine boys in the younger age group have higher ego identity mean scores than masculine girls from all three social classes (see table 19). The reverse is true for masculine boys and girls belonging to the older age group i.e. masculine girls in the older age group have higher ego identity mean scores than boys in all the three social classes.

Feminine boys from the upper (M = 7.64) and lower (M = 8.17) class are higher in their ego identity achievement than feminine girls in the younger age group. Middle class

</tbody>
</table>
feminine boys (M = 6.50) and girls (M = 6.77) in the younger age group are more or less equal in their ego identity. Lower class (M = 6.34) feminine girls and middle class (M = 8.50) feminine boys in the older age group have high ego identity scores.

Undifferentiated boys from upper (M = 7.33) and lower class (M = 6.33) in the younger age group have higher ego identity mean scores than undifferentiated girls in upper (M = 6.60) and lower (M = 5.00) class. Middle class undifferentiated boys (M = 6.08) and girls (M = 6.11) in the younger age group are more or less equal in their ego identity scores. In the older age group undifferentiated boys from upper (M = 6.80) and middle (M = 6.90) class have higher mean scores than their counterpart girls.

Table 21 shows a highly significant main effect of sex x sex roles x social class which indicates that ego identity is a function of sex (F = 8.603; df = 1; p < .01), sex roles (F = 25.709; df = 3; p < .01), and social class (F = 6.537; df = 2; p < .01).

The two way interaction effects of age x sex (F = 6.791; df = 1; p < .01) and sex x sex roles (F = 4.559; df = 3; p < .01) was found to be significant at .01 level. The two way interaction effects of age x sex roles (F = 2.079), age x social class (F = 0.620), sex x social class (F = 0.187) and sex roles x social class (F = 1.021) were found to be insignificant.

</table>

** p < .01.
* p < .05.
The three way interaction effects of age x sex x sex roles (F = 3.680; df=3; p < .05), age x sex x social class (F = 3.711; df=2; p < .05) as well as age x sex roles x social class (F = 3.464; df=6; p < .01) were found to be significant at .05 level. The three way interaction effect of sex x sex roles x social class (F = 0.166) was found to be insignificant in its effect on ego identity.

The four way interaction effect of age x sex x sex roles x social class (F = 3.565; df=6; p < .01) on ego identity was found to be significant at .01 level.

Hence, results in table 21 indicates rejection of the null-hypotheses 4, 7, 10, and 13 and retention of hypothesis 1.

3.5.b. Effect of age, sex, sex roles and social class on purpose-in-life.

Table 22 gives the means and standard deviations of purpose-in-life scores for age, sex, sex roles and social class.

Table 22 indicates that androgynous lower class boys (M = 106.32) and androgynous middle (M = 110.83) and upper class (M = 121.14) girls in the younger age group are higher in their purpose-in-life. Androgynous girls from lower (M = 108.00), middle (M = 109.67) and upper class (M = 111.91) in the older age group have a higher purpose-in-life than boys.

</tbody>
</table>

** p <.01.
* p <.05.
The two way interaction effects of sex x sex roles 
\(F = 3.047;\, df = 3;\, p < .05\) on PIL is significant at .05 level. 
The two way interaction effects of age x sex \(F = 2.438\), age x 
sex roles \(F = 1.116\) age x social class \(F = 0.125\), sex x 
social class \(F = 1.705\) and sex roles x social class 
\(F = 1.164\) on PIL is non-significant.

The three way interaction effects of age x sex x sex 
roles \(F = 0.137\), age x sex x social class \(F = 1.481\), age x 
sex roles x social class \(F = 1.504\), and sex x sex roles x 
social class \(F = 0.356\) on PIL is also found to be non-
significant.

The four way interaction effects of age x sex x sex roles 
x social class is found to be non-significant \(F = 1.421\).

Hence, results in table 23 indicates rejection of the 
null-hypotheses #s 8, 11, and retention of null-hypotheses #s 2, 5 & 14.
