ACKNOWLEDGMENTS

The author wishes to express her gratefulness to Professor (Mrs.) R. Rajalakshmi for visualising, guiding and helping to see through this project. Prof. Ramakrishnan's unfailing support, continuous encouragement and ever willing help in overcoming the difficulties associated with this kind of work are thankfully appreciated. The author also wishes to thank Dr. J.M.H. Buckler, Senior Lecturer, Department of Pediatrics and Child Health, The University of Leeds, Leeds, U.K., for his valuable suggestions; Mrs. Janet Walsh for correcting the thesis and Mrs. B.A. Wade for efficient typing.

Even though it would be rather impossible to list and acknowledge all the boys and girls who actively participated in this study, it must be mentioned that their continuous cooperation is the only cornerstone on which the success of this work rests.

Financial support from the University Grants Commission is gratefully appreciated.

Last, but not the least, the author wishes to acknowledge her profound indebtedness to her family members for their boundless patience and moral support throughout the course of this work.
