ACKNOWLEDGEMENT

The present dissertation submitted by me in requirement for the fulfillment of the Ph.D. degree in Economics is an effort wherein; the contributions of a host of persons in various forms deserve special mention. Hence, I shall be grossly at fault if not-a mention of them and their contributions finds a place in it.

The first person to whom I owe most is my teacher and supervisor (earlier at the M.Phil. and now at the Ph.D.Level) Professor Asit Kumar Banerjee, Department of Economics, Burdwan University, Burdwan 713104, West Bengal, India who at the first instance was kind enough to allow me to have a registration under him and to proceed with the research work. Thereafter, he took time-off from his busy schedule, many-a-time, to listen to my approach-logics and recommend suggestions and corrections to be introduced. Finally, he took great pain of minutely examining the manuscript of this dissertation thereby pruning the undesired portions to his satisfaction and imparting as much transparency as possible in the approach.

Professor Dilip Kumar Haider, Department of Economics, Jadavpur University, Kolkata 700032, West Bengal, India helped me to get access to the authentic transport study reports of the urban areas that formed the key data source and ready reckoner for this dissertation. Moreover, the introductory chapter, that brought into being the framework of the entire work, could not be shaped in the way it is, had not his whole-hearted support and advise been there.

The computational necessity poised by the model adopted was beyond my means to execute. It is only through proper econometric software that such a hurdle can be overcome with. The known ones are professional versions with a price tag that remain out of the purview of my wildest dream of procurement. It is then I approached Professor William Greene, Department of Economics, New York University Leonard N. Stern School of Business, United States and a developer of one such software with an earnest request to suggest a mean to solve my stalemate. Within days, he responded positively and allowed me a download of a software (that suffices my purpose) from his personal web-site, free of cost which I utilized extensively in this dissertation thus clearing the difficulty I was pegged with.

To these distinguished persons, I remain ever grateful.

Besides them, I would like to mention the name of Shri Sudeep Biswas, an M.Tech.(IT) student of IIT (Mumbai), India and a friend of mine whose continuous effort in cracking the program code of EALimDep (the software applied in this analysis) and successfully running it help achieve the desired objective that I longed for. His act was in the true spirit of friendship that I adore.

Also I owe much to the collective co-operation of my other teachers and staff of the Economics Department, The University of Burdwan apart from some unknown people of the National Library, Kolkata and the Indian Statistical Institute Library, Kolkata for their efficient service, every time I was in need for references.

Lastly, I remain solely responsible for any deficiency that may have crept in, despite my best endeavour to avoid them.

Asis Kumar Pain
