except the months of October and November, 1975 and September to November, 1976 as compared to the rotifers. The cladoceran was represented by the species *Daphnia similis*, *D. mala*; *Ceriodaphnia cornuta*, *C. reticulata*, *Daphnopsis* sp. and *Testudinella* sp.

The copepods were present in lesser numbers as compared to other major groups, in Chau Tal and I.T.I. pond. Whereas Nagla pond showed somewhat higher quantities of copepods. Among the copepods, the cyclopoids contributed maximum number as compared to calanoids. The cyclopoids and calanoids were represented by *Cyclops strenua*, *C. viridis*, *Neocalanida adax* and *Mantoea* sp. respectively.

A coefficient correlations were made between Rotifers to Cladocerans, Rotifers to Copepods and Cladocerans to Copepods.
