This thesis entitled, Water Balance and Landuse Planning: A case study of the Upper Damodar Basin, submitted towards the Ph.D. Degree in Geography from the University of Burdwan, is a very modest attempt to organise the various facts collected by me on land and water resources of the area under study, largely according to the guidelines set by Professor M.R. Chaudhuri, D.Litt(Cal) under whose formal supervision the work has been undertaken.

No words are sufficient enough to acknowledge the debt that I owe to Professor Chaudhuri who has constantly encouraged me and kindled my interest in the subject concerned and has guided me along the most appropriate course. Frankly speaking this work would not have been completed without the total involvement of Professor Chaudhuri in the pros and cons of this research. I owe my sincerest gratitude to Professor Chaudhuri for all his guidance and cooperation.

The author is greatly indebted to Shri R.K. Mukherjee, Jt. Director of the Damodar Valley Soil Conservation Department, Hazaribagh, Shri S.K. Ghose, Ex-Director, Office of the Alipur Regional Meteorological Department, Dr. Sarajit Dutta, P.R.O., D.V.C. Bhabanibhaban who spent their valuable time in providing guidance and suggestion for the preparation of the present work.
