Preface

The works imbedded in this thesis have been possible not only due to my hard work but also due to supports received from others at different points of time, directly or indirectly.

First of all, I must thank and offer my sincere acknowledgement to Prof. E. J. Thomas of the Department of Chemistry, The University of Manchester, England, for introducing me into the wonderful world of tin chemistry. Works on tin chemistry (Part I) was possible only because of him who allowed me to use his laboratory facilities during my visit to his laboratory as a Commonwealth Fellow. Thanks to the Commonwealth Scholarship Commission in London for providing me financial assistance to make my stay in Manchester possible. I offer my sincere acknowledgement to all in the technical staff of the Department of Chemistry, The University of Manchester, for the spectroscopic measurements, micro analyses and other measurements, especially to Dr. Madeleine Helliwell for Single Crystal X-ray Analysis.

In spite of severe constraints in infrastructural facilities, the work on the Michael addition reactions (Part II) could be completed in the Department of Chemistry, Gauhati University. I enjoyed working in the laboratory because of the company extended by my Ph.D. students. I am thankful to them for their helping hands, especially to Sukanya, Diganta, Maumita, Pankaj (Kalita), Biswajit, Nripen, Hari Sankar, Bhaskar, Dhiresh, Sanjay, Kajal, Pankaj (Saikia), Priyanka, Pranita, Tiluttama, Swarnali, Vimal, Abdul Halim, Satya, Monmi, Nitumani, Agni and others. Thanks to IIT Guwahati, especially to Prof. A T Khan and Prof. B K Patel of the Department of Chemistry, for their help in recording some of the NMR spectra.

Finally, I would like to record my thanks to my family, especially my wife Krishna, and children Raja and Rishi, for their wholehearted support to me in this endeavor.

Dibakar Chandra Deka
