The following pronunciation system in this thesis will show clearly how each word should be pronounced. The method adopted for accepting the proper pronunciation of the word is simple and will indeed be understood at a glance.

The following phonetic symbols have been adopted as the method for showing pronunciation. However, in the case of such letters which have no corresponding sound letters in Roman, the technique has been developed by indicating dots and accents immediately below or above the letters to bring out correct accepted pronunciation of the letter in Persian.

The transliteration and pronunciation can be considered authentic as these have been duly verified from standard dictionaries and reputed works of reference.

\[\begin{align*}
\text{\textcircled{1}} & = \text{a} \\
\text{\textcircled{1}} & = \text{a} \\
\text{\textcircled{1}} & = \text{b} \\
\text{\textcircled{1}} & = \text{bh} \\
\text{\textcircled{1}} & = \text{p} \\
\text{\textcircled{1}} & = \text{ph} \\
\text{\textcircled{1}} & = \text{t} \\
\end{align*}\]
Note: Due to typing difficulty, the dots under various letters and the diatrical marks (dashes) below and above the letters and long vowels have been avoided from the transliteration system as given above.
