List of Tables

I. Total area of cultivation, production and average yield of potato in Assam during the crop seasons 1980-84.

II. Total annual rainfall (mm) of different districts of Assam during the years 1981-84.

III. Identification of the races of *P. infestans* occurring in the district of Lakhimpur, Assam.

IV. Radial growth (cm) of *P. infestans* in different solid media.

V. Dry mycelial wt. (mg/15 ml) of *P. infestans* in different liquid media.

VI. Colony character, nature of growth and size of sporangium of three races of *P. infestans*.

VII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different carbon compounds.

VIII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of glucose.

IX. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different nitrogen compounds.

X. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of asparagine.

XI. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different sulphur compounds.

XII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of magnesium sulphate.

XIII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different phosphorus compounds.

XIV. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of pot. dihydrogen phosphate.

XV. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different trace elements.

XVI. Dry mycelial wt. (mg/15 ml) of *P. infestans* at different temperature levels.

XVII. Radial growth (cm) of *P. infestans* at different humidity levels.
XVIII. Course of development of late blight disease in a potato plot planted with healthy tubers during the crop season 1982-83.

XIX. Course of development of late blight disease in a potato plot planted with inoculated tubers during the crop season 1982-83.

XX. Percentage of sporangia of P. infestans dispersed at various hours of the day.

XXI. Deposition of sporangia (percent) of P. infestans at various hours of the day.

XXII. Infectivity of sporangia (percent) of P. infestans at various hours of the day.

XXIII. Rate of growth of lesion (mm/24 hr) of P. infestans in detached and attached leaves of two cultivars of potato in relation to plant age and leaf position.

XXIV. Effect of inoculum concentration on growth of lesion of P. infestans (mm/24 hr) on leaves of two cultivars of potato.

XXV. Rate of growth of lesion (mm/24 hr) on abaxial and adaxial surfaces of potato leaves in relation to plant age and leaf position.

XXVI. Diameter of lesion (mm) of P. infestans on leaves of potato cv. Up-to-date treated with different combinations of nitrogen, phosphorus and potassium in relation to plant age.

XXVII. Diameter of lesion (mm) of P. infestans on leaves of potato cv. Up-to-date treated with different combinations of nitrogen, phosphorus and potassium in relation to the position of leaves on the stem.

XXVIII. Chlorophyll content (mg/g) of healthy and infected leaves of potato.

XXIX. Chlorophyll content (mg/g) of potato leaves in relation to position on the stem.

XXX. Chlorophyll content (mg/g) of leaves of potato plants treated with different concentration of potassium.

XXXI. Total soluble sugar and starch content (percent) of Potato plant tissues in relation to infection by P. infestans.

XXXII. Total soluble sugar and starch content (%) of potato leaf tissues in relation to position on the stem.
XXXIII. Total soluble sugar and starch content (percent) of potato leaf tissues treated with different concentration of potassium.

XXXIV. Total soluble sugar and starch content (percent) of potato tuber tissue treated with different light condition.

XXXV. Amino acid content of potato plant tissues in relation to infection by *P. infestans*.

XXXVI. Amino acid content of potato leaves in relation to position on the stem.

XXXVII. Amino acid content of potato leaves treated with different concentration of potassium.

XXXVIII. Amino acid content of potato tuber tissue treated with different light conditions.

XXXIX. Chlorogenic acid content (mg/100 gm) of potato plant tissue in relation to infection by *P. infestans*.

XL. Chlorogenic acid content (mg/100 g) of potato leaves in relation to their position on the stem.

IXL. Chlorogenic acid content (mg/100 g) of potato leaf tissues treated with different concentration of potassium.

IXXL. Chlorogenic acid content (mg/100 g) of potato tuber tissue treated with different light conditions.

IIXL. Peroxidase activity of potato plant tissues in relation to infection by *P. infestans*.

IXXL. Peroxidase activity of potato leaf tissues in relation to their position on the stem.

VXL. Peroxidase activity of leaves of potato plants treated with different concentrations of potassium.

VIXL. Peroxidase activity of potato tuber tissue treated with different light conditions.

VIIXL. Polyphenoloxidase activity of potato plant tissue in relation to infection by *P. infestans*.

VIIIXL. Polyphenoloxidase activity of potato leaf tissue in relation to their position on the stem.

IXXL. Polyphenoloxidase activity of leaves of potato plants treated with different concentration of potassium.
L. Polyphenoloxidase activity of potato tuber tissue treated with different light conditions.

LI. Total no. of fungi, bacteria and actinomycetes (colonies per 100 cm²) on young and old leaves of two cultivars of potato.

LII. Total fungal population (no. of colonies per 100 cm²) on abaxial and adaxial surfaces of potato leaves during the period from November to March, 1983-84.

LIII. Monthly variations in the population of air microorganisms (no. of colonies per 100 cm²) over a field of potato of cv. Up-to-date.

LIV. Persistence of sporangia of P. infestans (expressed as percentage of tuber octants infected) in field soil under potato crop in different months of the crop season.

LV. Mechanical proportion and chemical analysis of four different soil types.

LVI. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) in different soil types.

LVII. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) in sterilized and non sterilized soils.

LVIII. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) at different leaves of soil temperature.

LIX. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) at different leaves of soil moisture.

LX. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) at different levels of soil pH.

LXI. Total fungi, bacteria and actinomycetes present on the tuber surface of young and old plants of two potato cultivars.

LXII. Percentage of mycelial inhibition of P. infestans by different soil fungi.

LXIII. Percentage of mycelial inhibition of P. infestans by different fungicides at varying concentrations.

LXIV. Results of spraying trials on the incidence of late blight disease during the crop seasons 1982-83 and 1983-84.
