LIST OF FIGURES

1. Radial growth (cm) of *P. infestans* in different solid media.

2. Dry mycelial wt. (mg/15 ml) of *P. infestans* in different liquid media.

3. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different carbon compounds.

4. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different nitrogen compounds.

5. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different nitrogen compounds. Interaction between isolate and nitrogen compounds.

6. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different sulphur compounds.

7. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of glucose, asparagine and magnesium sulphate. Interaction between isolate and concentration of the compounds.

8. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different phosphorous compounds.

9. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different trace elements.

10. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of glucose, asparagine, magnesium sulphate and potassium dihydrogen phosphate.

11. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different carbon, nitrogen, sulphur, phosphorus and trace elements. Interaction between race and different compounds.

12. Dry mycelial wt. (mg/15 ml) of *P. infestans* at different temperature levels.
13. Radial growth (cm) of *P. infestans* at different humidity levels.

14. Course of development of late blight disease in a potato plot planted with healthy tubers during the crop season 1982-83.

15. Blight intensity (percent) in a potato plot planted with healthy tubers during the crop season 1982-83.

16. Course of development of late blight disease in a potato plot planted with inoculated tubers during the crop season, 1982-83.

17. Blight intensity (percent) in a potato plot planted with inoculated seed tubers during the crop season 1982-83.

18. Dispersal of sporangia (percent) of *P. infestans* at various hours of the day.

19. Deposition of sporangia (percent) of *P. infestans* at various hours of the day.

20. Infectivity of sporangia (percent) of *P. infestans* trapped at various hours of the day.

21. Rate of growth of lesion (mm/24 hr) of *P. infestans* at varying concentration of inoculum.

22. Rate of growth of lesion of *P. infestans* (mm/24 hr) on two surfaces of potato leaves as affected by plant age and leaf position.

23. Diameter of lesion (mm) of *P. infestans* on leaves of potato plants treated with different combinations of nitrogen, phosphorus and potassium in relation to plant age. Interaction between fertilizer and plant age (days).

24. Diameter of lesion (mm) of *P. infestans* on leaves of potato plants treated with different combinations of nitrogen, phosphorus and potassium in relation to position of leaves.
on stem. Interaction between fertilizer and leaf position.

25. Chlorophyll content (mg/g) of potato leaves in relation to infection by \textit{P. infestans}.

26. Chlorophyll content (mg/g) of potato leaves treated with different concentration of potassium.

27. Total soluble sugar and starch content of potato plant tissue in relation to infection of \textit{P. infestans}. Interaction between cultivar and days of incubation.

28. Total soluble sugar and starch content (percent) of potato leaf tissues in relation to position on the stem. Interaction between leaf position and sugar and starch content.

29. Total soluble sugar and starch content (percent) of leaves of potato plants treated with different concentrations of potassium.

30. Total soluble sugar and starch content (percent) of potato tuber tissue treated with different light conditions.

31. Chlorogenic acid content (mg/100 g) potato plant tissue in relation to infection of \textit{P. infestans}. Interaction between plant tissue and days of incubation.

32. Chlorogenic acid content (mg/100 g) of potato leaf tissue in relation to position on stem. Interaction between cultivar and leaf position.

33. Activity of enzyme peroxidase (expressed as differences in optical density between treated and boiled extracts) in potato plant tissue in relation to infection by \textit{P. infestans}.

34. Activity of enzyme polyphenoloxidase (expressed as difference in optical density between treated and boiled extracts) in potato plant tissues in relation to infection by \textit{P. infestans}.

35. Population of fungi, bacteria and actinomycetes (colonies/100 cm$^2$) in the phylloplane of young and old leaves of potato during the period of November to March 1983-84.
36. Population of fungi, bacteria and actinomycetes in the phylloplane of two cultivars of potato during the period from November to March 1983-84. (Results are expressed as no. of colonies/100 cm²).

37. Population of fungi (colonies/100 cm²) on adaxial and abaxial surfaces of leaves of potato.

38. Population of fungi, bacteria and actinomycetes (colonies/100 cm²) in the air over a field of potato during the period from November to March 1983-84.

39. Population of fungi, bacteria and actinomycetes at different heights in the air over a field of potato (Results expressed as no. of colonies/100 cm² area).

40. Effect of soil factors on the viability of sporangia (expressed as percentage of tuber octant infected) of P. infestans.

41. Viability of sporangia of P. infestans (expressed as percentage of tuber octants infected) in sterilized and non-sterilized soils.

42. Inhibition of mycelial growth (percent) of P. infestans by different fungicides at varying concentrations. Interaction between concentration and fungicides.
