LIST OF ANALYSIS OF VARIANCE TABLES

I. Radial growth of *P. infestans* (cm) in different solid media.

II. Dry mycelial wt. (mg/15 ml) of *P. infestans* in different liquid media.

III. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different carbon compounds.

IV. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of glucose.

V. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different nitrogen compounds.

VI. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of asparagine.

VII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different sulphur compounds.

VIII. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of magnesium sulphate.

IX. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different phosphorus compounds.

X. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different concentrations of potassium dihydrogen phosphate.

XI. Dry mycelial wt. (mg/15 ml) of *P. infestans* in media containing different trace elements.

XII. Dry mycelial wt. (mg/15 ml) of *P. infestans* at different temperature levels.

XIII. Radial growth (cm) of *P. infestans* at different humidity levels.
XIV. Dispersal of sporangia of *P. infestans* (percent) at various hours of the day.

XV. Deposition of sporangia of *P. infestans* at various hours of the day.

XVI. Infectivity of sporangia of *P. infestans* trapped at various hours of the day.

XVII. Rate of growth of lesion (mm/24 hr) of *P. infestans* in resistant and susceptible cultivar of potato at varying concentration of inoculam.

XVIII. Rate of growth of lesion (mm/24 hr) on two surfaces of potato leaves of resistant and susceptible cultivars in relation to plant age and leaf position.

XIX. Diameter of lesion (mm) of *P. infestans* on leaves of potato cv. Up-to-date treated with different combination of N, P, K in relation to position of leaves on the stem.

XX. Diameter of lesion (mm) of *P. infestans* on leaves of potato cv. Up-to-date treated with different combinations of N, P, K in relation to plant age.

XXI. Chlorophyll content (mg/g) of potato leaves in relation to infection by *P. infestans*.

XXII. Chlorophyll content (mg/g) of potato leaves in relation to position on the stem.

XXIII. Chlorophyll content (mg/g) of potato leaves treated with different concentrations of potassium.

XXIV. Total soluble sugar and starch content (%) of potato plant tissues in relation to infection by *P. infestans*.

XXV. Total soluble sugar and starch content (%) of potato leaf tissues in relation to position on the stem.

XXVI. Total soluble sugar and starch content (%) of potato leaf tissues treated with different concentration of potassium.
XXVII. Total soluble sugar and starch content (%) of potato tuber tissues treated with different light conditions.

XXVIII. Chlorogenic acid content (mg/100 g) of potato plant tissues in relation to infection of *P. infestans*.

XXIX. Chlorogenic acid content (mg/100 g) of potato leaf tissue in relation to position on the stem.

XXX. Chlorogenic acid content (mg/100 g) of potato leaf tissue treated with different concentrations of potassium.

XXXI. Chlorogenic acid content (mg/100 g) of potato tuber tissue treated with different light conditions.

XXXII. Viability of sporangia of *P. infestans* in different soil types.

XXXIII. Viability of sporangia of *P. infestans* in sterilized and non-sterilized soils.

XXXIV. Viability of sporangia of *P. infestans* at different levels of soil temperature.

XXXV. Viability of sporangia of *P. infestans* at different levels of soil moisture.

XXXVI. Viability of sporangia of *P. infestans* at different levels of soil pH.

XXXVII. Percentage of mycelial inhibition of *P. infestans* by different fungicides at varying concentrations.
