CONTENTS

1. INTRODUCTION

2. MATERIALS AND METHODS

SESBANIA MOSAIC VIRUS
Collection, establishment and maintenance
Virus purification
   UV-absorption characteristics
   Quantitation of the purified virus

Electron Microscopy

Serology
   Production of antiserum
   Cross absorption of antiserum
   Antiserum titre
   Antigen titre

Serological relationships
   Agarose gel double diffusion test
   Enzyme linked immunosorbent assay
   Dot immunobinding assay

Virus coat protein
   Mr determination
   Electroblot immunoassay

Virus nucleic acid
   Isolation from purified virus
   Nucleic acid type
   Infectivity assay
   Agarose gel electrophoresis
   Mr determination

Double-stranded nucleic acid
   Isolation from C. tetragonoloba
   tissue infected with SMV
Agarose gel electrophoresis
Mr determination
Nuclease treatments

**Virus coat protein**
  Isolation of coat protein
  Reduction and carboxymethylation of coat protein
  Homogeneity checking of coat protein by SDS-PAGE
  Acid hydrolysis of coat protein
  Amino acid composition of coat protein
  N-terminal analysis of coat protein

**Enzymatic cleavage of coat protein**
  Tryptic digestion
  Chymotryptic digestion
  Clostripain digestion and
  $\gamma$ protease digestion

**Purification of peptides by HPLC**
  Chromatography & Rechromatography of
  individual peak fractions

Electrophoretic separation of peptides by Tricine SDS-gels
Electrotransfer of peptides on to PVDF membrane

**Sequencing of peptides**
  Manual (DABITC/PITC double coupling method)
  Automated (in PSQ-I gas phase sequenator)
  Comparison of SMV amino acid sequence to SBMV-Cp
  and SBMV-B strain amino acid sequences.

**LOCAL LESION STRAIN OF TRSV:**
Collection, establishment and maintenance

**Purification of TRSV**
  Quantitation of the purified virus
  UV absorption characteristics
Electron microscopy

Serology
  Production of polyclonal antibodies
  Cross absorption of antiserum
  Antiserum titre
  Antigen titre
  Serological relationships

Virus coat protein
  Mr determination

Virus nucleic acid
  Isolation from purified virus
  Nucleic acid type
  Infectivity assay
  Agarose gel electrophoresis of RNA

Double-stranded RNA isolation
  Agarose gel electrophoresis
  Mr determination and
  Nuclease treatment

Virus coat protein
  Native coat protein isolation
  Reduction and carboxymethylation
  Acid hydrolysis of coat protein
  Amino acid composition of coat protein

RESULTS 84-100

DISCUSSION 101-125

SUMMARY & CONCLUSIONS 126-135
