CONTENTS

I. INTRODUCTION ................................................................. 1-5

II. REVIEW OF LITERATURE ................................................. 6-46

1 Sugarcane ............................................................................ 6
   1.1 Economic products of sugarcane .................................... 6
   1.2 Sugarcane production .................................................. 6
   1.3 Abiotic factors ............................................................ 6
   1.4 Biotic factors ............................................................. 6
       Insect and nematode pests ............................................. 6
       Fungal, bacterial and phytoplasmal diseases ................. 6
       Virus diseases ......................................................... 6
       Mosaic disease ....................................................... 6

2 Characterization and identification of plant viruses .......... 11
   2.1 Biological properties ................................................ 11
   2.2 Physical properties ................................................. 11
   2.3 Serological properties ............................................. 11
   2.4 Molecular properties .............................................. 11

3 Characterization and identification of potyviruses .......... 17
   3.1 Biological properties ................................................ 17
   3.2 Physical properties ................................................. 17
   3.3 Serological properties ............................................. 17
   3.4 Molecular properties .............................................. 17

4 Characterization of SCMV and identification of SCMV ...... 25
   subgroup of viruses ..................................................... 25
       4.1 Biological characteristics ....................................... 25
       4.2 Physical characteristics ......................................... 25
       4.3 Serological relationships ....................................... 25
       4.4 Differentiation based on molecular approaches ......... 25
       4.5 Status of the Indian SCMV isolates ......................... 25

5 Detection of plant viruses ............................................... 31
   5.1 Biological tests ..................................................... 31
   5.2 Biophysical tests ................................................... 31
5.3 Immunological tests
5.4 Virus nucleic acid based tests
   Dot-blot hybridization
   Polymerase chain reaction (PCR)
6 Detection of potyviruses 38
   6.1 Immunological tests
   6.2 Virus nucleic acid based tests
   Dot-blot hybridization tests
   PCR
7 Detection of viruses in sugarcane 43
8 Aims of the present investigation 45

III. MATERIALS AND METHODS 47-98

1 Collection and maintenance of virus culture 47
   1.1 Source of virus culture
   1.2 Test plants
   1.3 Sap preparation and inoculation
   1.4 Propagation through sugarcane sets
2 Host range 48
3 Aphid transmission 48
4 Virus stability in extracted leaf sap 49
5 Cytopathology 50
   5.1 Fixation of tissues and preparation of blocks
   5.2 Ultramicrotomy
   5.3 Staining and observation under EM
6 Virus purification 52
   6.1 Purification
   6.2 Infectivity assay
   6.3 UV-light absorption
   6.4 Virus quantification
7 Particle morphology 53
8 Serology 54
   8.1 Production of polyclonal antiserum
   8.2 Determination of antiserum titres by DAC-ELISA
8.3 Serological relationships
   DAC-ELISA
   EBIA

9  Virus coat protein
   9.1 Molecular weight determination by SDS-PAGE
   9.2 Glycoprotein staining
   9.3 Isolation
   9.4 Partial tryptic peptide analysis
      9.4.1 Tryptic digestion of coat protein
      9.4.2 Separation of tryptic peptides
      9.4.3 Electrotransfer of peptides
      9.4.4 Amino acid sequence analysis

10 Virus nucleic acid (genome)
   10.1 Preparation of glass/plasticware and reagents
   10.2 Isolation
      10.2.1 UV-light absorption and quantification of virus nucleic acid
      10.2.2 Infectivity assay
   10.3 Nucleic acid type
      Orcinol test
      Diphenylamine test
      Nuclease sensitivity test
   10.4 Molecular weight
   10.5 Cloning and sequencing
      10.5.1 Preparation of reagents
      10.5.2 cDNA synthesis to virus RNA
         Synthesis of first strand
         Synthesis of second strand
      10.5.3 Cloning of cDNA into plasmid vector
         Preparation of cut vector
         Ligation
         Preparation of E. coli component cells
         Transformation
         Identification of recombination clones
         Blue/White system
         Colony hybridization
Sub-culturing of recombinant clones
Recombinant plasmid DNA analysis
Isolation
Estimation

10.5.4 Northern hybridization
Total RNA isolation
Analysis of RNA by gel electrophoresis
Capillary blotting
Preparation of virus-specific probe
Prehybridization and hybridization

10.5.5 Sequencing of cDNA clones
Manual sequencing
Automated sequencing
Analysis of sequence data

11 Virus detection
11.1 Bioassay
11.2 Antibody based tests
Antiserum production
Isolation of immunoglobulins
DEAE cellulose column chromatography
Conjugation of alkaline phosphatase to IgG
DAS-ELISA
DAC-ELISA

11.3 Nucleic acid probe based tests
Slot-blot hybridization
Preparation of samples
Blotting
Preparation of $^{32}$P probe
Prehybridization and hybridization
Autoradiography
DIG labeling
Preparation of DIG probe
Hybridization
Detection
12 Comparison of South Indian virus isolates with sugarcane virus

12.1 Collection and maintenance of virus isolates
   Sap inoculation
   Propagation through setts

12.2 Host reactions

12.3 Antigenic relationships
   AGDDT
   DAC-ELISA
   EBIA

12.4 Slot-blot hybridization

IV RESULTS

1. Symptoms
   Symptoms on infected sugarcane (cv. local)
   Symptoms on Sorghum bicolor (cv. Rio)

2 Host range

3 Aphid transmission

4 Virus stability in buffered leaf sap

5 Cytopathology

6 Virus purification
   UV-light absorption spectrum
   Infectivity assay

7 Particle morphology

8 Serology
   Production of antiserum
   Antiserum titre
   Serological relationships

9 Virus coat protein
   Molecular weight
   Glycoprotein analysis
   Partial tryptic peptide and amino acid sequence analysis

10 Virus nucleic acid

10.1 Isolation
   UV-light absorption spectrum
   Infectivity assay
10.2 Nucleic acid type
10.3 Molecular weight
10.4 Cloning
   cDNA synthesis to virus RNA and cloning
   Identification of recombinant clones
   Northern hybridization
10.5 DNA sequencing
   Sequence analysis

11 Virus detection
11.1 Bioassay
11.2 Antibody based techniques
11.3 Nucleic acid probe based tests
   \(^{32}\text{P}\) probe
   DIG probe

12 Comparison of South Indian isolates causing mosaic disease of sugarcane
   12.1 Host range
   12.2 Antigenic relationships
   12.3 Nucleic acid based analysis

V. DISCUSSION

VI SUMMARY AND CONCLUSIONS

REFERENCES
