CHAPTER - 1 INTRODUCTION

Introduction........................................................................................................ 1
Need for the study.............................................................................................. 4
    Need for the measurement of the output of the hearing aid in the ear canal................................................................. 5
    Need for studying the representation of acoustic cues available at brainstem level................................................................. 6
    Need for studying the representation of acoustic cues available at the cortical level................................................................. 8
Aim and objectives of the study ................................................................. 11
Statement of the problem........................................................................... 13
Hypotheses.................................................................................................. 15

CHAPTER - 2 REVIEW OF LITERATURE

Acoustics of Speech....................................................................................... 16
Representation of speech in the auditory system......................................... 17
    External and middle ear........................................................................ 19
    Inner ear.............................................................................................. 20
    Auditory nerve.................................................................................... 21
    Auditory brainstem.............................................................................. 22
    Auditory cortex.................................................................................. 25
Physiological changes on the perception of speech from aging and hearing.......................................................................................... 27
loss related factors

Biological aging

Hearing loss

Absolute threshold

Frequency resolution

Temporal resolution

Acceptable noise level (ANL)

Acoustic analysis of hearing aid output

Effect of amplification on acoustic cues

Evaluation of hearing aid output using probe microphone

Physiological measures of the auditory system

Late latency response (LLR)

Acoustic change complex (ACC)

CHAPTER 3

METHOD

Participants

Clinical Group

Normal hearing Group

Test environment

Instrumentation

Stimulus preparation

Procedure

Phase 1: Selection and grouping of participants

Phase 2: Measurement of the output of the hearing aid in the ear canal

Electroacoustic analysis of testing hearing aid
Programming of test hearing aid using NAL-NL1 prescriptive procedure........................................... 94
Optimization of hearing aid gain using insertion gain measurement and audibility of Ling’s six syllables........... 94
Phase 3: Measurement of the representation of amplified speech at the brainstem and cortical level using electrophysiological measure.................................................. 98
Response analyses...................................................................................................................... 102
Analyses of spectral and temporal aspects of speech syllables at the ear canal................................................................. 102
Analyses of representation of speech syllables at the level of auditory brainstem ............................................................ 105
Analyses of representation of speech syllables at the level of auditory cortex................................................................. 108
Statistical Analyses.................................................................................................................. 114

CHAPTER - 4 RESULTS

At the ear canal level, the spectral and temporal parameters of speech syllables in unaided and aided conditions........................................ 116
  Effect of hearing aid processing on spectral parameter of speech stimuli................................................................. 118
  Effect of hearing aid processing on temporal parameter of speech stimuli................................................................. 128
At the brainstem level, the representation of speech syllables in clinical group and group having normal hearing.......................... 130
  Comparison of the aided slope of V-A from clinical group with unaided slope of V-A from group with normal hearing........ 130
  Comparison of FFR in terms of aided F₀, F₀ energy and F₁ energy in clinical group with unaided F₀, F₀ energy and F₁ energy in group having normal hearing................................................................. 137
At the cortical level, the representation of speech syllables in clinical group and group with normal hearing.................................................. 154

Comparison of aided slope of N1-P2 in clinical group with unaided slope of N1-P2 in group having normal hearing.............. 154

Comparison of latency of ACC components in aided condition from clinical group with unaided condition from group having normal hearing................................................................. 160

Comparison of amplitude of ACC components in aided condition from clinical group with unaided amplitude from group having normal hearing................................................................. 170

Comparison of brainstem responses and cortical responses in good and poor hearing aid performers .................................................. 177

Comparison of the brainstem responses in good and poor hearing aid performers................................................................. 178

Comparison of slope of V-A in good hearing aid performers and poor hearing aid performers............................................... 178

Comparison of FFR in terms of F0 of FFR, F0 energy and F1 energy between good hearing aid performers and poor hearing aid performers................................................................. 181

Comparison of the cortical responses in good and poor hearing aid performers ................................................................. 189

Comparison of slope of N1-P2 in good hearing aid performers and poor hearing aid performers............................................... 189

Comparison of latency of ACC components in good hearing aid performers and poor hearing aid performers............................................... 191

Comparison of amplitude of ACC components in good hearing aid performers and poor hearing aid performers............................................... 197
CHAPTER - 5 DISCUSSION

At the ear canal level, the spectral and temporal parameters of speech syllables in unaided and aided conditions ........................................ 205

Effect of hearing aid processing on spectral parameters of speech stimuli ........................................................ 205

Effect of hearing aid processing on temporal parameter (EDI) of speech stimuli .................................................. 208

At the brainstem level, the representation of speech syllables in clinical group and group with normal hearing.......................... 209

Representation of speech syllables at the brainstem level of auditory pathway in clinical sub-groups ................................. 209

Representation of speech syllables at the brainstem level of the auditory pathway in the sub-groups of normal hearing ............... 211

Comparison of the aided slope of V-A from clinical group with unaided slope of V-A from group having normal hearing........ 214

Comparison of the aided F0, F0 energy and F1 energy from clinical group and unaided F0, F0 energy and F1 energy from group having normal hearing .................................................. 214

At the cortical level, the representation of speech syllables in clinical group and group with normal hearing................................. 217

Representation of speech syllables at the cortical level of auditory pathway in the clinical sub-groups ................................. 217

Representation of speech syllables at the cortical level of auditory pathway in the sub-groups having normal hearing ............... 218

Comparison of the cortical responses (slope of N1-P2, latency and amplitude of ACC) between clinical group and group having normal hearing .................................................. 219

Comparison of brainstem responses and cortical responses in good and poor hearing aid performers ........................................ 221

Comparison of slope of V-A in good hearing aid performers
and poor hearing aid performers.................................................. 221
Comparison of F₀ of FFR, F₀ energy and F₁ energy in good
hearing aid performers and poor hearing aid performers.............. 222
Comparison of cortical responses in good and poor
hearing aid performers............................................................ 224

CHAPTER - 6 SUMMARY AND CONCLUSIONS.............................. 230

IMPLIEDATIONS OF THE STUDY.................................................. 234

FUTURE DIRECTIONS................................................................. 235

REFERENCES............................................................................. 237

APPENDIX
  Appendix I – Information to the participants of clinical group ........ 268
  Appendix II- Information to the participants of group having normal
  hearing ...................................................................................... 270
