ACKNOWLEDGMENTS

The deep gratitude that I feel for my supervisor, Dr Datta Madamwar, is beyond the scope of this acknowledgment and would require a thesis. His unswerving trust and confidence in me, has always inspired me to greater accomplishment; I respectfully bow to him.

I am indebted to my guide and mentor, Dr Datta Madamwar and Dr Nikki Garg for offering valuable suggestions and pointing out errors of fact and procedure. What scientific mistakes remain result from my invocation of scientific license, or, more likely, my own ignorance.

I acknowledge my thanks to the University Grants Commission for financial support.

My thanks are due to Prof. P. M. Mehta, Head, Department of Biosciences for providing excellent laboratory facilities.

A special word of thanks to Dr Javed Khan, Reader In English, for agreeing to wield his scalpel on the most crucial aspect of this work: ENGLISH LANGUAGE.

I also wish to thank the Head and staff of the University Scientific and Instrumentation Centre, for the ever-ready and willing technical assistance provided during this tenure.

I owe gratitude to my research colleagues, especially Dr Sangeeta Patel and Dr Chirag Patel. My colleagues never accepted that something was impossible. We all expected and received miracles throughout this odyssey, and we have all grown and become more close in the process. There is difficulty in assigning a hierarchy since it has been a true team effort from the beginning.

To the giants whose shoulders I stand upon, the teachers who have shaped so much of my philosophy, strategies and skill, I acknowledge you and I salute you once again.

To my phenomenally selfless family members, whose cheerful support and unconditional love pulled me through the bumpy roads, and whose input I always hold valuable, I am eternally grateful.

In closing, I want to take this opportunity to send a heartfelt thank you to all my friends who have supported me over the last several years.

RAJVIT BAGAI
I believe that water will one day be employed as fuel, that hydrogen and oxygen which constitute it used singly or together will furnish an inexhaustible source of heat and light.

JULES VERNE (1874)
