List of Figures

4.1.1 Variation of normal stress \( \sigma \) at \((x = a/2, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.15)\) subjected to single sine load in cylindrical bending. ..... 64

4.1.2 Variation of transverse shear stress \( \tau \sub{xz} \) at \((x = 0, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.15)\) subjected to single sine load in cylindrical bending. ..... 65

4.1.3 Variation of normal stress \( \sigma \) at \((x = a/2, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.25)\) subjected to single sine load in cylindrical bending. ..... 66

4.1.4 Variation of transverse shear stress \( \tau \sub{xz} \) at \((x = 0, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.25)\) subjected to single sine load in cylindrical bending. ..... 67

4.1.5 Variation of normal stress \( \sigma \) at \((x = a/2, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.35)\) subjected to single sine load in cylindrical bending. ..... 68

4.1.6 Variation of transverse shear stress \( \tau \sub{xz} \) at \((x = 0, z)\) through the thickness of orthotropic plate \((E_x / E_y = 2, h/a = 0.35)\) subjected to single sine load in cylindrical bending. ..... 69

4.1.7 Variation of normal stress \( \sigma \) at \((x = a/2, z)\) through the thickness of orthotropic plate \((E_x / E_y = 25, h/a = 0.15)\) subjected to single sine load in cylindrical bending. ..... 70

4.1.8 Variation of transverse shear stress \( \tau \sub{xz} \) at \((x = 0, z)\) through the thickness of orthotropic plate \((E_x / E_y = 25, h/a = 0.15)\) subjected to single sine load in cylindrical bending. ..... 71

4.1.9 Variation of normal stress \( \sigma \) at \((x = a/2, z)\) through the thickness of orthotropic plate \((E_x / E_y = 25, h/a = 0.25)\) subjected to single sine load in cylindrical bending. ..... 72
4.1.10 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, z)$ through the thickness of orthotropic plate $(E_L/E_T = 25, h/a = 0.25)$ subjected to single sine load in cylindrical bending. ................................................................. 73

4.1.11 Variation of normal stress $\sigma_x$ at $(x = a/2, z)$ through the thickness of orthotropic plate $(E_L/E_T = 25, h/a = 0.35)$ subjected to single sine load in cylindrical bending... 74

4.1.12 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, z)$ through the thickness of orthotropic plate $(E_L/E_T = 2, h/a = 0.35)$ subjected to single sine load in cylindrical bending................................................................. 75

4.2.1 Variation of inplane displacement $\vec{u}$ at $(x = a/2, z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10 in cylindrical bending. ............... 81

4.2.2 Variation of normal stress $\sigma_x$ at $(x = a/2, z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10 in cylindrical bending............................................. 82

4.2.3 Variation transverse shear stress $\tau_{xz}$ at $(x = 0, z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10 in cylindrical bending .......... 83

4.2.4 Variation of inplane displacement $\vec{u}$ at $(x = a/2, z)$ through the thickness of a plate subjected to uniformly distributed load with aspect ratio 10 in cylindrical bending. 84

4.2.5 Variation of normal stress $\sigma_x$ at $(x = a/2, z)$ through the thickness of a plate subjected to uniformly distributed with aspect ratio 10 in cylindrical bending............... 85

4.2.6 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, z)$ through the thickness of a plate subjected to uniformly distributed with aspect ratio 10 in cylindrical bending ..... 86

4.2.7 Variation of normal stress $\sigma_x$ at $(x = a/2, z)$ through the thickness of a plate subjected to central concentrated line load with aspect ratio 10 in cylindrical bending......... 92

4.2.8 Variation transverse shear stress $\tau_{xz}$ at $(x = 0, z)$ through the thickness of a plate subjected to central concentrated line load with aspect ratio 10 in cylindrical bending ................................................................. 93
4.3.1 Variation of maximum transverse displacement $\bar{w}$ at $(x = a/2, \ y = b/2, \ z)$ of a square plate subjected to single sine load with aspect ratio $(a/h)$ ............................................. 101

4.3.2 Variation of inplane displacement $\bar{u}$ at $(x = 0, \ y = b/2, \ z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10. .................................................. 102

4.3.3 Variation of normal stress $\bar{\sigma}_x$ at $(x = a/2, \ y = b/2, \ z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10. ............................................. 103

4.3.4 Variation of inplane shear stress $\bar{\tau}_{xy}$ at $(x = 0, \ y = 0, \ z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10. ............................................. 104

4.3.5 Variation of transverse shear stress $\bar{\tau}_{xz}$ at $(x = 0, \ y = b/2, \ z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10. ............................................. 105

4.3.6 Variation of transverse normal stress $\bar{\sigma}_z$ at $(x = a/2, \ y = b/2, \ z)$ through the thickness of a plate subjected to single sine load with aspect ratio 10. ............................................. 106

4.3.7 Variation of inplane displacement $\bar{u}$ at $(x = 0, \ y = b/2, \ z)$ through the thickness of a plate subjected to uniformly distributed load with aspect ratio 10. ............................. 107

4.3.8 Variation of normal stress $\bar{\sigma}_x$ at $(x = 0, \ y = b/2, \ z)$ through the thickness of a plate subjected to uniformly distributed load with aspect ratio 10. ............................................. 108

4.3.9 Variation of inplane shear stress $\bar{\tau}_{xy}$ at $(x = 0, \ y = 0, \ z)$ through the thickness of a plate subjected to uniformly distributed load with aspect ratio 10. ............................................. 109

4.3.10 Variation of transverse shear stress $\bar{\tau}_{xz}$ at $(x = 0, \ y = b/2, \ z)$ through the thickness of a plate subjected to uniformly distributed load with aspect ratio 10. ............................................. 110

4.4.1 Variation of fundamental frequency $\bar{\omega}_u$ in flexural mode with aspect ratio $S$ of a simply supported square plate................................................................. 118

4.4.2 Variation of frequency of free vibration thickness shear mode $\bar{\omega}_p$ in flexural mode with aspect ratio $S$ of a simply supported square plate................................................................. 119

4.4.3 Variation of frequency of free vibration thickness shear mode $\bar{\omega}_p$ in flexural mode with aspect ratio $S$ of a simply supported square plate................................................................. 120
4.5.1 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic plate subjected to single sine load for aspect ratio $10$. .......................... 123

4.5.2 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic plate subjected to single sine load for aspect ratio $10$. .......................... 124

4.5.3 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic plate subjected to single sine load for aspect ratio $10$. .......................... 125

4.5.4 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic plate subjected to single sine load for aspect ratio $10$. .......................... 126

4.5.5 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic plate subjected to single sine load for aspect ratio $10$. .......................... 127

4.5.6 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic plate subjected to uniformly distributed load for aspect ratio $10$. ....... 128

4.5.7 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic plate subjected to uniformly distributed load for aspect ratio $10$. ....... 129

4.5.8 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic plate subjected to uniformly distributed load for aspect ratio $10$. ....... 130

4.5.9 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic plate subjected to uniformly distributed load for aspect ratio $10$. ....... 131

4.5.10 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic plate subjected to uniformly distributed load for aspect ratio $10$. ....... 132

4.6.1 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic two layered $(0/90)$ laminate subjected to single sine load for aspect ratio $10$. .......................................................... 137

4.6.2 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic two layered $(0/90)$ laminate subjected to single sine load for aspect ratio $10$. .......................................................... 138
4.6.3 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to single sine load for aspect ratio 10. .............................................................. 139

4.6.4 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to single sine load for aspect ratio 10. ........................................................................... 140

4.6.5 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to single sine load for aspect ratio 10. ........................................................................... 141

4.6.6 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic two layered (0/90) laminated plate subjected to uniformly distributed load for aspect ratio 10. ........................................................................... 142

4.6.7 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to uniformly distributed load for aspect ratio 10. ........................................................................... 143

4.6.8 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to uniformly distributed load for aspect ratio 10. ........................................................................... 144

4.6.9 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to uniformly distributed load for aspect ratio 10. ........................................................................... 145

4.6.10 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic two layered (0/90) laminate subjected to uniformly distributed load for aspect ratio 10. ........................................................................... 146

4.7.1 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to single sine load for aspect ratio 10. ........................................................................... 151
4.7.2 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to single sine load for aspect ratio $10$. ................................................................. 152

4.7.3 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to single sine load for aspect ratio $10$. ................................................................. 153

4.7.4 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to single sine load for aspect ratio $10$. ................................................................. 154

4.7.5 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to single sine load for aspect ratio $10$. ................................................................. 155

4.7.6 Variation of normal stress $\sigma_x$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to uniformly distributed load for aspect ratio $10$. ................................................................. 156

4.7.7 Variation of normal stress $\sigma_y$ at $(x = a/2, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to uniformly distributed load for aspect ratio $10$. ................................................................. 157

4.7.8 Variation of inplane shear stress $\tau_{xy}$ at $(x = 0, y = 0, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to uniformly distributed load for aspect ratio $10$. ................................................................. 158

4.7.9 Variation of transverse shear stress $\tau_{xz}$ at $(x = 0, y = b/2, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to uniformly distributed load for aspect ratio $10$. ................................................................. 159

4.7.10 Variation of transverse shear stress $\tau_{yz}$ at $(x = a/2, y = 0, z)$ through the thickness of orthotropic three layered (0/90/0) laminated plate subjected to uniformly distributed load for aspect ratio $10$. ................................................................. 160
