List of Tables

1.1 Fundamental constitutes of matter (leptons and quarks) as described in the Standard Model. ........................................ 2

1.2 The forces by which the leptons and quarks interact, their carriers, charges of the carriers ($Q_e$) and the masses in GeV units. .... 3

3.1 NC DIS Monte Carlo events used in this analysis for 2006-07 $e^+p$ data. The first column gives lower cut value for $Q^2$, the second column gives the number of events generated for MEPS and Ariadne MCs respectively. 36

8.1 The cross-section table for 2006-07 $e^+p$ NC scattering. The first two columns of the table contain the $Q^2$ and $x$ values at which the cross section is quoted, events, the third contains the number of events reconstructed in the bin, $N$, the fourth contains the measured cross section $d^2\sigma/dxdQ^2$ or the upper limit in case of zero observed, the fifth contains the statistical uncertainty, $\delta_{\text{stat}}$, and the sixth contains the total systematic uncertainty, $\delta_{\text{sys}}$. The right part of the table lists the total uncorrelated systematic uncertainty, $\delta_u$, followed by the bin-to-bin correlated systematic uncertainties $\delta_1$ $\delta_3$ defined in the text (Sec. 7.3.1). The upper (lower) numbers refer to the variation of the cross section, whereas the signs of the numbers reflect the direction of change in the cross sections. Note that the normalization uncertainty, $\delta_4$ is not listed. 132
8.2 The integral cross section table for 2006-07 $e^+p$ NC scattering. The first two columns of the table contain the $Q^2$ and $x_{\text{edge}}$ values for the bin, the third contains the number of events reconstructed in the bin, $N$, the fourth contains the measured cross section $\int_{x_{\text{edge}}}^{1} d^2\sigma/dxdQ^2$ or the upper limit in case of zero observed events, the fifth contains the statistical uncertainty, $\delta_{\text{stat}}$, and the sixth contains the total systematic uncertainty, $\delta_{\text{sys}}$. The right part of the table lists the total uncorrelated systematic uncertainty, $\delta_u$, followed by the bin-to-bin correlated systematic uncertainties $\delta_1$, $\delta_3$ defined in the text. The upper (lower) numbers refer to the variation of the cross section, whereas the signs of the numbers reflect the direction of change in the cross sections. Note that the normalization uncertainty, $\delta_4$ is not listed.

8.3 The summary table for $xF_3$ and $F_2$ structure functions calculated using 185 pb$^{-1}$ of ZEUS $e^-p$ data and 142$^{-1}$ of ZEUS $e^+$ data. The first two columns of the table contain the $Q^2$ and $x$ values at which the measurements is quoted, the third contains the value of $xF_3$ structure function and the fourth column shows the smallest interval containing marginalised 68% probability interval. The fifth column contains the value of $F_2$ structure function and the sixth column shows the smallest interval containing marginalised 68% probability interval for $F_2$.
