ACKNOWLEDGEMENTS

I am greatly indebted to Professor Vishwa Nath, Sc.D. (Cantab.), F.K.S., formerly Head of the Department of Zoology, Panjab University, and now Emeritus Professor of Zoology, for suggesting me this problem, besides supervising my work and correcting the manuscript of this thesis. I am grateful to him for giving me an opportunity to work in the Department and for his most valuable criticism and suggestions in the course of these investigations. I am indebted to Professor G. T. Sharma, M. Sc., Ph.D. (Edin.), Head of the Department of Zoology, Panjab University for the keen interest that he has been taking in the present investigations, and for the valuable advice and unfailing encouragement that I have always received from him. I thank Mr. Brij Gupta, M.Sc., Technician to the Department for his valuable help during the study of living material under the phase-contrast microscope and for taking the photomicrographs.

I must also thank Dr. John H. Baker, D.Sc., F.R.S., Joint Editor, Quarterly Journal of Microscopical Science for his most valuable criticism of the manuscripts of the papers dealing with Evotethus macrophthalmus and Herpetonias muscarum, published in that journal.
