ACKNOWLEDGEMENTS

This dissertation describes work carried out at the Dana-Farber Cancer Institute (DFCI) in Boston, USA between June 2008 and December 2010. DFCI is an affiliated hospital to Harvard Medical School, Boston. My research work was funded through Lustgarten Foundation that principally focuses on pancreatic cancer research. When many people open this work, browse through it, perhaps even read a few chapters; they will realize that this is not only the work of the person whose name is on the front cover. This work has many contributors. Some had direct scientific input, while others fulfilled a supporting role. This is an ideal place to thank all of them.

Although the work was carried out at DFCI, it should be emphasized that without the support and cooperation of the technical and non-technical staff at Acharya Nagarjuna University (ANU) and all faculty members and administrative staff of the Center for Biotechnology, ANU, this dissertation would have been impossible. My sincere thanks to each and every one of them. In particular, I would like to thank the administrative staff of the University Research Cell and the Department of Biotechnology. I would like to thank Research Committee of the Biotechnology Dept. for kindly reviewing my thesis and providing valuable comments.

For the last three years I have had Dr. James DeCaprio as my mentor and project’s Principal Investigator to whom I am most thankful for his tremendous support and advice. I am very grateful to him for allowing me the freedom to develop my scientific interests and define my own area of research. None of the work presented in this dissertation would have been possible without his guidance and encouragement. My PhD would have been impossible without the support of Dr. Ajita Singh who served
as my Research Adviser. I owe her my profound admiration and respect for her critical views and thoughtful suggestions. My special thanks to Prof. Sambasivarao Krothapalli for his invaluable suggestions and continuous support throughout my PhD. I could not have made to this point without his help. I would like to thank Prof. C. S. N. Raju, Coordinator of ANU Research Cell for his help in the administrative issues.

I would like to express my gratitude to all members, who are also my colleagues, of the Monoclonal Antibody Core, DFCI, for their support and stimulating work-atmosphere. I am very thankful to Edward Greenfield for his extreme support and invaluable advice throughout my journey as a graduate student. I have learned so many interesting aspects of hybridoma technology from him. I want to acknowledge the help of Matthew Holsti in peptide immunizations of mice. Many thanks to Craig Benescis and Carlo Ciatto for their contribution in designing peptides and for coming to the rescue several times to help me out with the most diverse problems. Thanks to Christina for her help with the administrative issues and thanks to Ping and Yuhua. My special thanks go to John McGrath of Belfer group for providing the pancreatic cancer cell lines. I would like to thank the members of Dr. DeCaprio’s lab, in particular Jingwei Chen for providing helpful thoughts in Gateway cloning.

My special thanks to Dr. Samir Hanash and his technician, Melissa Johnson for providing patient samples and testing the ELISA assays on them. Clinical data presented in this dissertation would have been impossible without the collaboration of Dr. Hanash’s lab, Fred Hutchinson Cancer Research Center, Seattle, USA. The list of biomarker targets presented in this study was a result of work done by our collaborators. It has to be emphasized that none of the work described in this
dissertation would have been possible without their efforts. Special acknowledgements go to Lustgarten Foundation for the financial support of the project. I would like to thank Molecular Biology Core Facilities for performing DNA sequencing and thanks to the RNAi Consortium for providing all shRNA clones used in this study. I would also like to thank all mice, used in this study, for risking their lives to provide valuable antibodies.

I am as well very thankful to Dr. Prabhala Hanumantha Rao and his family who helped me a lot to come this far from India and work in one of the most respected research institutes in the world. I am also grateful to my previous supervisors, Dr. Shuji Ogino, Dr. Charles Fuchs, Dr. Loda Massimo and Dr. Dharminder Chauhan for making my journey at DFCI so memorable. I would like to take this opportunity to express my extreme respect to my under-graduate lecturers, Srinivas Sharma, Sai and Yogeswararao for their outstanding inspiration. I want to thank all of my friends, both in the USA and back in India for their encouragement and help. Particularly I would like to thank my friends here in the USA for their constructive and valuable comments in the dissertation.

Last, but definitely most, I would like to thank my family. My greatest gratitude goes to my wonderful wife, Neelima and my daughter Laasya who have supported me unconditionally all these years. Thanks to my wife for her time and encouragement all along my thrilling ride of nine years at DFCI. My special thanks to my sisters Jayasree and Padmasree for their extreme support. I would like to conclude by thanking my parents. Words cannot express my thanks and respect to them whose blessings has made me go this far in my way of career although I cannot share this moment of glory with my dad. I dedicate this work to my father and mother.
