ACKNOWLEDGEMENTS

I feel honoured to express my deepest thanks to my worthiest and most esteemed teacher, Dr. H.M. Dani (Ph.D. Panjab and London), Professor of Biochemistry, Chief Co-ordinator, Centre of Environmental Sciences and Dean, Faculty of Science, Panjab University, Chandigarh, India, under whose supervision I had an opportunity to pursue the work presented in this thesis.

My sincere thanks are also due to Dr. R.C. Bansal, Chairman, Department of Biochemistry and Prof. R.K. Jethi, Ex-Chairman, Department of Biochemistry for providing the necessary research facilities.

The timely help and cooperation that came from Dr. Sunil K. Arora, Department of Pathology, Postgraduate Institute of Medical Education and Research, Chandigarh and all other friends and colleagues is gratefully acknowledged.

I am obliged to Mr. Pritam of Biophysics Department and all members of the Technical Staff of Biochemistry Department for their help. I also thank M/s Harbans Reprographic Aids, Panjab University for neatly typing my manuscript.

I do not find adequate words to express my most fervent reverence to my mother, brothers and other family members for their incessant encouragement and outstanding support. I owe a great deal to my wife, Radha, for bearing the separation and sustaining my interest in this study. My daughters, who could not receive fatherly cares all these years, are worth all praise and affection.

This research was financed by the University Grants Commission, New Delhi in the form of a National Junior Research Fellowship and is gratefully acknowledged.

KRISHAN KUMAR SHARMA
