LIST OF ILLUSTRATIONS

Fig. 1. The apparatus for the study of the effect of different levels of water and salinity on fruit plants.

Fig. 2. Effects of different water tables and salinity levels on the percentage increase in height, diameter, spread of plant and length of roots.

Fig. 3. Effect of different water tables and salinity levels on fresh weight of tops and roots and chlorophyll content of leaves.

Fig. 4. Number of leaves expressed in percentage under different salt concentrations in light soil (September, 1960).

Fig. 5. Percentage mortality under different salt concentrations in light soil (September, 1960).

Fig. 6. Number of leaves expressed in percentage under different salt concentrations in heavy soils (March, 1961).

Fig. 7. Number of leaves expressed in percentage under different salt concentrations in heavy soil (March, 1961).

Fig. 8. Number of leaves expressed in percentage under different salt concentrations in light soil (March, 1961).

Fig. 9. Number of leaves expressed in percentage under different salt concentrations in heavy soil (March, 1961).

Fig. 10. Number of leaves expressed in percentage under different salt concentrations in light soil (March, 1961).

Fig. 11. Percentage mortality under different salt concentrations in heavy soil (March, 1961).

Fig. 12. Percentage mortality under different salt concentrations in light soil (March, 1961).

Fig. 13. Percentage mortality under different salt concentrations in heavy soil (March, 1961).

Fig. 14. Percentage mortality under different salt concentrations in light soil (September, 1961).

Fig. 15. Percentage mortality under different salt concentrations in heavy soil (September, 1961).

Fig. 16. Percentage mortality under different salt concentrations in light soil (September, 1961).
Fig. 16a. Effect of different salt concentrations on the chlorophyll content of leaves in light soil.

Fig. 17. Number of leaves expressed in percentage under different salt concentrations in light soil (September, 1961).

Fig. 18. Number of leaves expressed in percentage of Blood Red scion budded on different stocks under medium salt concentrations (NaCl 1500 ppm + Na2SO4 200 ppm + NaHCO3 210 ppm + Borax 2.5 ppm) in light soil.

Fig. 19. Percentage mortality of Blood Red scion budded on different stocks under medium salt concentrations (NaCl 1500 ppm + Na2SO4 200 ppm + NaHCO3 210 ppm + Borax 2.5 ppm) in light soil.

Fig. 20. Number of leaves of different scions expressed in percentage under medium salt concentration (NaCl 1500 ppm + Na2SO4 200 ppm + NaHCO3 210 ppm + Borax 2.5 ppm) in light soil.

Fig. 21. Percentage mortality of different scions budded on rough lemon under medium salt concentrations (NaCl 1500 ppm + Na2SO4 200 ppm + NaHCO3 210 ppm + Borax 2.5 ppm) in light soil.

Plate 1. Effect of different salinity levels at 1 foot and 4 feet water tables on sweet orange seven months after planting.

Plate 2. Effect of different water tables and salinity levels on the growth of sweet orange seven months after planting.

Plate 3. Effect of different water tables with different salinity levels on the root growth of sweet orange eighteen months after planting.

Plate 4. Effect of different salinity levels at 1 and 4 feet water tables on the root growth of sweet orange eighteen months after planting.

Plate 5. Effect of medium salt concentrations on sweet orange eight months after planting.

Plate 6. Residual effect of high and medium salt concentrations on the growth of maize one month after sowing.
Plate 7. Residual effect of high and medium salt concentrations on the growth of wheat three months after sowing.

Plate 8. Effect of low salt concentrations on sweet orange in light soil eight months after planting.

Plate 9. Effect of reduced salt concentrations on sweet orange in light soil eight months after planting.
